Edwards, Denis, Made from Stardust: Exploring the Place of Human Beings Within Creation. North Blackburn, Australia: Collins Dove, 1992. 81 pages. \$ 9.00. Edwards, a Roman Catholic priest of the Archdiocese of Adelaide Australia, begins with a meditation on an Australian aboriginal story that provides insight into the interconnectedness of the universe as a whole, and develops a Biblical account that moves away from an anthropocentrism that sees the world as given for humanity's use alone. This is related to evolutionary science, as well as to astrophysics. He closes with a plea for social justice and the well-being of the planet based on the integrity of creation. Edwards lectures in systematic theology in the Adelaide College of Divinity. (v5,#4)

Edwards, Denis, "An Ecological Theology of the Trinity," CTNS (Center for Theology and the Natural Sciences, Berkeley) Bulletin 13, no 3. Summer 1993. Ultimate reality is understood as persons in dynamic communion. This means that all of creation, the whole universe, the biosphere on Earth, individual ecosystems, a living tree, a cell, or a proton can be understood as fundamentally relational and part of a network of interrelationships. Edwards is a Roman Catholic priest and theologian from Australia, the author of Jesus the Wisdom of God: An Ecological Theology, Orbis Press, forthcoming. (v5,#1)

Edwards, Denis, ed., Earth Revealing. Earth Healing: Ecology and Christian Theology. Collegeville, Minn: Liturgical Press, 2001. Christian theology as a theology of the Earth. (v.12,#4)

Edwards, Denis. Jesus the Wisdom of God: An Ecological Theology. Maryknoll, NY: Orbis, 1995. 208 pages. \$ 16.95 paper. The Biblical wisdom literature and contemporary creation thought can be used to formulate an integrated ecological theology. What it means to recover the notion that Sophia-Wisdom became incarnate in Jesus of Nazareth and how the universe is altered by this incarnation. The trinitarian theology of Richard of St. Victor and St. Bonaventure find that every creature, including humans, is the free self-expression of the trinitarian God. Humanity is integrally related to all creation. Edwards is a Roman Catholic priest and lectures in theology in the Adelaide, Australia, College of Divinity. (v6,#3)

Edwards, Michael, Future Positive: International Co-operation in the 21st Century. London: Earthscan Publications, 1999. Sub-Saharan Africa is in deep trouble. The cruelties of its warlords and the miseries of the people displaced by war are but the most visible and dramatic results of declining economics and the unraveling social fabric. Much of Africa is drifting to the margins of the world system. "Africa's crisis is really one of governance." Edwards is with the Ford Foundation, and has a long career in non-governmental developmental agencies. (v.11,#1)

Edwards, P. J., R. M. May, and N. R. Webb, eds., Large Scale Ecology and Conservation Biology. Cambridge: Blackwell Scientific Publications, 1994. 416 pages. Paper, \$ 29.95. Claims to be the first book ever published that examines the feasibility of using a large scale ecological approach to solve some of the world's most pressing environmental problems. Some topics: the effects of spatial scale on ecological questions and answers; animal distributions; metapopulations and conservation; definitions and categories for describing the conservation status of species; turning conservation goals into tangible results, the ecological component of economic policy; translating ecological science into practical policy. Edwards is in biology at the University of Southampton, UK; May is in zoology at Oxford, Webb is a researcher in Dorset, England. (v5,#1)

Edwards, Robert, "Bags of rubbish," The Ecologist 30(no.8, NOV 01 2000):52- . Plastic bags, says Robert Edwards, are choking the life out of India. And that's just how the plastics industry likes it. (EE v.12,#1)

Edwards, Steven E., "In Defense of Environmental Economics," Environmental Ethics 9(1987):73-85. A rebuttal to the frequent environmentalist criticisms of economic rationality in the determination of environmental policy. (Katz, Bibl # 1)

Edwards, Steven E. "In Defense of Environmental Economics." Environmental Ethics 9(1987):73-85. The appropriateness of economic valuations of the natural environment is defended on the basis of an objective analysis of individuals' preferences. The egoistic model of "economic man" substantiates economic valuations of instrumental values even when markets do not exist and when consumption and use are not involved. However, "altruistic man's" genuine commitment to the well-being of others, particularly wildlife and future generations, challenges economic valuations at a fundamental level. In this case, self-interest and an indifference between states of the world are secondary and undefined respectively, since preferences are not based on tradeoffs between the welfare of others and self. The appropriateness of economic valuations rests solely with the empirical validity of the assumptions that give rise to economic man. Edwards is at Woods Hole Oceanographic Institute, Woods Hole, MA. (EE)

Edwards, V. M., Dealing in Diversity: America's Market for Nature Conservation. Cambridge: Cambridge University Press, 1995. Can market-based approaches be used successfully to conserve biodiversity? Should environmentalists eschew government regulation of private land-owners and the public purchase of conservation lands and instead strengthen private activities that further conservation. Edwards answers yes to both these questions. Edwards teaches land management at the University of Portsmouth, England.

Edwards, Victoria. Dealing in Diversity: America's Market for Nature Conservation. Cambridge, 1995. 182 pp. This book examines the "market" for conservation of natural areas in the U.S. considering the efforts of both profit and non profit organizations. (v8,#2)

An extended book review essay on William Easterly The Elusive Quest for Growth: Economists' Adventures and Misadventures in the Tropics and E.O. Wilson's The Future of Life. Egan is a graduate student in political science at Virginia Polytechnic Institute and State University

Egan, Michael., "The Social Significance of the Environmental Crisis: Barry Commoner's 'The Closing Circle'". Organization and Environment, 15, (No. 4, 2002): 443-457. The author argues that Barry Commoner's "The Closing Circle" has retained its immediate relevance better than any comparable environmental volume from the 1960s or 1970s due to Commoner's ability to articulate the social ramifications of environmental decline. This close reading of "The Closing Circle" proposes to situate Commoner's most important book in its social and historical context, paying particular attention to Commoner's four laws of ecology and to his role in changing the fight for the environment from a scientific debate to a public one. Egan is a doctoral student in the Department of History at Washington State University, working on a dissertation about Commoner's career as an environmentalist.

Egan, Michael. *Barry Commoner and the Science of Survival: The Remaking of American Environmentalism*. Cambridge: MA: The MIT Press, 2007. Egan recounts Barry Commoner's career from calling attention to the hazards of nuclear fallout to raising public awareness of the environmental dangers posed by the petrochemical industry. Commoner drew connections between the environmental, civil rights, labor, and peace movements; he connected environmental decline with exploitation, injustice, poverty, and war; and he argued that the root cause of environmental problems was the American economic system and its manifestations. Egan argues that Commoner's commitments to the dissemination of scientific information, the importance of dissent, and the need for citizen empowerment were instrumental in helping remake American environmentalism.

Egg, The : An Eco-Justice Quarterly is now in volume 12. The quarterly explores critical issues of ecology and justice. Short articles, book reviews, news, and a steady update on these issues. Contact: Eco-Justice Project and Network, Anabel Taylor Hall, Cornell University, Ithaca, NY 14853-1011. The

editor is Dieter T. Hessel. (v4,#1)

Eggleston, J. E., S. S. Rixecker, and G. J. Hickling, "The Role of Ethics in the Management of New Zealand's Wild Mammals," New Zealand Journal of Zoology 30(2003):361-376. New Zealand's wild mammals are introduced species. Wildlife researchers and managers in New Zealand find animal welfare guidelines developed for captive and domestic animals unsuitable for this new context. The recommendation that New Zealand adopt an ecocentric ethic is also incomplete for this situation. The authors here propose a more comprehensive framework for considering ethical responsibility to New Zealand's introduced ungulates, and also for pest species. Under this framework some contemporary assumptions must be questioned, such as justifying recreational hunting through the provision of an ecologically therapeutic role. The authors present a comprehensive process of ethical consideration in management decision-making for other introduced wild mammal species. Eggleston is in Philosophy and Religious Studies, University of Canterbury, Christchurch, New Zealand. Rixecker is in Environment, Society and Design Division, Lincoln University, Christchurch, NZ. Hickling is in Fisheries and Wildlife, Michigan State University, East Lansing.

Ehmann, William, "Environmental Virtue Ethics With Martha Stewart," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001): 51-57. Renewed philosophical discourse about virtue ethics motivates the search for examples to inform and extend our thinking. In the case of environmental virtue ethics, I have decided to consult "America's Lifestyle Expert," Martha Stewart. Oft dismissed as a pop icon or model of domesticity, Martha's business success is arguably a result of her claimed authority on what the good life entails and how we get it. Reviewing over 60 signed "Letters From Martha" from her monthly magazine Martha Stewart Living, I explored her presentations of current environmental topics including biodiversity, obligations to animals, gardening, global warming, and reliance on technology. I find that her work ultimately makes managing a household interesting, and encourages her public to take personal pride in everyday tasks done well. These are trademark Martha Stewart "good things." Moreover, by connecting with a large audience few philosophers or scientists ever court, she is poised to help us manage our larger planetary household and frame a quality of life for future generations. Ehmann is Director, Center for Earth and Environmental Science, Plattsburgh State University-SUNY, Plattsburgh, New York. (v.13,#2)

Ehrenfeld, David, Beginning Again: People and Nature in the New Millennium. New York: Oxford University Press, 1993. 216 pages. Hardcover. \$ 22.00. A collection of essays. "Human population, powered by an unforgiving, ill-adapted, and poorly functioning technology, is rapidly growing past the inevitable crash point." Gary Nabhan says, "Not since Sand County Almanac has an ecologist given us so many enduring insights and principles to inspire and guide our lives on this planet." Ehrenfeld is in natural resources at Rutgers University. (v4,#2)

Ehrenfeld, David, "Environmental Protection: The Expert's Dilemma," Report from the Institute for Philosophy and Public Policy, Vol. 11, no. 2, Spring 1991, pp. 8-12. "We believe implicitly in our models. The more specific the predictions are, the more we believe in them, no matter how scientifically preposterous and absurd that specificity is." "Every project with an environmental component should make provision for public education about that work. Why should the public value what we do if it does not know what it is for?" An address given to the Oregon Chapter of the American Fisheries Society at a conference on science and advocacy. Ehrenfeld is professor of biology in the Department of Environmental Resources at Cook College, Rutgers University, and the editor of Conservation Biology. (v2,#2)

Ehrenfeld, David, "War and Peace and Conservation Biology," Conservation Biology 14 (2000): 105-112. Conservation biology is, like medicine, a mission-oriented field. But most of the papers published in Conservation Biology since its origins thirteen years ago, though scientifically rigorous and often with useful recommendations, do not make much difference in practice. The deeper problem may be that the forces jeopardizing biodiversity have little to do with biology, and no amount of good biology will solve the problem. Tolstoy made this point in War and Peace: expertise and reason do not control the major events of the times. But a more moderate position is possible. Conservation biologists can make important and relevant scientific discoveries, but must give up the belief that science itself is a solution. Conservation science must go into critical feedback loops, as does medicine, and monitor its actual effectiveness in the whole human community. Ehrenfeld is in the Department of Ecology, Evolution, and Natural Resources, Cook College, Rutgers University.

Ehrlich, Paul H., "Human Natures, Nature Conservation, and Environmental Ethics," BioScience 52(January 2002):31-43. Human behavior, though requiring a genetic basis, is largely culturally determined. "Our complex and flexible behavior is largely determined by our environments, and especially by the extragenetic information embodied in our cultures" (p. 32). "Cultures already have been evolving in the direction of broader environmental ethics, and that process needs to be accelerated. ... "It behooves us to try to understand how cultural evolution operates on the ethics of environmental preservation." (p. 32) "There is abundant evidence that different behaviors toward the environment are not

in any significant way programmed into the human genome" (p. 36). (So much for Wilson's biophilia.)

"More social scientists must join the quest for sustainability and help to construct an interdisciplinary theory of cultural microevolution that will provide background for efforts to consciously and democratically influence its trajectory" (p. 32). "I and others believe not only that, like any other citizens, environmental scientists can be advocates but also that they ethically must be advocates, at least to the extent of informing the general public about their work and conclusions." "The needed changes in ethics are underway, and with focused effort we may learn how to accelerate them while maintaining open democratic debate" (p. 40) Ehrlich is in biology at Stanford University. (v.13,#2)

Ehrlich, Paul, "Human Natures, Nature Conservation, and Environmental Ethics," BioScience 52(no. 1, 2002):31-43. "There is general agreement among scientists that the accelerating loss of biodiversity should be a matter of great concern. They have concluded that nature must be conserved not just for its own sake but also for the sake of Homo sapiens, to which it supplies an indispensable array of ecosystem services. And for most of these scientists, and large numbers of environmentalists, conservation is a major ethical issue. ... But the seriousness of the human predicament is still unknown to the vast majority of the general public and decisionmakers worldwide. ... As a result the cutting edge of the environmental sciences is now moving from the ecological and physical sciences toward the behavioral sciences, which seem to have the potential to develop ways to improve that response." Ehrlich is in biology, Stanford University.

Ehrlich, Paul R., Anne H. Ehrlich, and Gretchen C. Daily, The Stork and the Plow: The Equity Answer to the Human Dilemma. New York: Grosset/Putnam, 1995. The population-consumption problem and its connection with the environment. The authors are at Stanford University. (v7,#1)

Ehrlich, Paul R. Human Natures: Genes, Cultures, and the Human Prospect. Covelo, CA: Island Press, 2000. 542 pages. Cloth \$29.95. Using personal anecdote, vivid example, and narrative, Ehrlich searches his way through the thicket of controversies over what science can and cannot say about the influence of our evolutionary past on everything from race to religion, from sexual orientation to economic development. Ehrlich attempts a fresh view of human natures and evolution, applying this to questions such as who and where we are as a species, and where we may be headed. (v.11,#4)

Ehrlich, Paul R., and Anne H. Ehrlich, Betrayal of Science and Reason: How Anti-Environmental Rhetoric Threatens Our Future. Washington: Island Press, 1996. 352 pages. \$ 24.95 hardcover. The anti-environmental backlash or "brownlash" is evidence of the success of the environmental movement, but it needs particular attention. Environmentalists must find the flaws in the brownlash movement and expose them. With much personal experience of the issues at points at hand. The Ehrlichs are at Stanford University. (v7,#4)

Ehrlich, Paul, and Kremen, Claire, "Human Effects on Ecosystems, Overview," Encyclopedia of Biodiversity 3: 383-394. Two central issues concerning biodiversity today are the roles that plants, animals, fungi, and microorganisms play in the functioning of ecosystems, and the primarily negative impacts of human beings on those ecosystems. Here we focus on the latter, starting with the rise of humanity as a geophysical force and then examining in some detail current anthropogenic alteration of ecosystems and the prospects of further damage by human beings to the delivery of ecosystem goods and services. Finally, we look at ways in which human damage to ecosystems could be limited in the future. (v.11,#4)

Ehrlich, Paul R. and Edward O. Wilson, "Biodiversity Studies: Science and Policy," Science, August 16, 1991, "The loss of biodiversity should be of concern to everyone for three basic reasons. The first is

ethical and esthetic. ... The second reason is that humanity has already obtained enormous direct economic benefits from biodiversity. ... The third reason, perhaps the most poorly evaluated to date, is the array of essential services provided by natural ecosystems." (v2,#3)

Ehrlich, Paul R., and Anne H. Ehrlich, One with Nineveh: Politics, Consumption and the Human Future. Washington, DC: Island Press, 2004. The combination of population growth, rampant consumption, and environmental degradation seriously threatens the livelihoods of the have-nots today and will increasingly threaten the haves in the none-too-distant future. Insecurity, hunger, and the recognition that one is entitled to a better world can breed a certain rage that will eventually find a voice. We humans today are one with Nineveh in our predilection for weakening the natural resource base that shores up the whole of human activity. However, we diverge from Nineveh in our technological capacity, our global reach, and the rapidity with which we can inflict change. Our fate will be worse than Nineveh's. Local collapses can no longer be contained. And global rescue will require a new evolutionary step--a "conscious cultural evolution" that allows us to overcome the limitations of individual perception and formulate a more responsive societal whole. Humanity's capacity to shape the planet has become more profound than our ability to recognize the consequences of our collective activity. Paul Ehrlich is in biology, Stanford University. (v. 15, # 3)

Ehrlich, Paul R., "Bioethics: Are Our Priorities Right?" BioScience 53(no. 12, 2003):1207-1216. Neither biologists nor nonbiologists are paying adequate attention to the escalating ethical issues raised by the human predicament, and the expertise of biologists seems to demand they make additional contributions to environmental ethics, broadly defined. Massive environmental destruction and the development of biological and nuclear weapons have changed the world; cultural evolution of ethics has not kept pace. "Bioethics" must be expanded from its focus on medical issues to consider such things as the ethics of preserving natural capital for future generations and those of dealing with overconsumption. Bioethics should examine issues as diverse as the ethics of invading Iraq to increase the role of the rich in generating climate change and the ethics of the Lomborg affair. Achieving a sustainable global society will require developing an agreed-upon ethical basis for the necessary political discourse, and the time to start is now. Ehrlich is in biology, Stanford University.

Ehrlich, Paul R., and Lawrence H. Goulder. "Is Current Consumption Excessive? A General Framework for Some Indications for the United States." Conservation Biology Vol. 21, no. 5 (2007): 1145-54. Many prior studies have explored the implications of human population growth and environmentally problematic technologies for biodiversity loss and other forms of environmental degradation. Relatively few, however, have examined the impacts of the level and composition of consumption. The authors offer a framework that shows how the level and composition of a society's total consumption relate to the uses of various forms of capital and to the sustainability of natural resources and human well-being.

Eichler, Margrit, "Introduction," Environments 28(no.2, 2000): 1-. In/equity and Un/sustainability: Exploring Intersections. (v.12,#3)

Eilperin, Juliet, "GOP Group Forms to Promote Free-Market Environmentalism," Washington Post (6/15/98): A6.Green GOP group forms. The Coalition of Republican Environmental Advocates has formed to promote free-market solutions to environmental problems. The group aims to show that the GOP is not opposed to environmental protection, but prefers approaches to achieving conservation other than traditional, governmental command and control. The group hopes to counter the barrage of negative publicity Republicans have encountered on environmental issues and to prevent surrendering the issue to Al Gore in 2000. House speaker Newt Gingrich hopes the group can redefine what it means to be an environmentalist: "The Al Gore, left-wing environmental model is a centralized, bureaucratized, litigious, adversarial, anti-technology model. . . Let's create a conservationist, common-sense, practical, high tech environmental model." Members of the group included vocal property rights advocate and

Colorado Attorney General Gale Norton (a protégé of Reagan Interior Secretary James Watt), Endangered Species Act foe Rep. Richard Pombo of California, and Rep. Helen Chenoweth of Idaho, who once joked she wasn't concerned about salmon being endangered because "you can buy a can in Albertson's," a local supermarket. Two-thirds of the Senators who have joined the group have ratings of zero from the League of Conservation Voters, including Majority Leader Trent Lott of Mississippi. Republicans known to be pro-environment, such as Rep. Sherwood Bohmert of New York, have decided not to join. (v9,#2)

Ekeli, Kristian Skagen, "Giving a Voice to Posterity -- Deliberative Democracy and Representation of Future People," Journal of Agricultural and Environmental Ethics 18(2005):429-450. Ought some seats in a democratically elected legislative assembly be reserved for representatives of future generations. I propose a new democratic model for representing posterity. This model has several advantages compared with a model for the democratic representation of future people previously suggested by Andrew Dobson. Nevertheless, the democratic model that I propose confronts at least two difficult problems. First, it faces insoluble problems of representative legitimacy. Second, one might question whether this model provides a reasonably effective way to represent future interest. Despite such problems, political representation of posterity can be defended.

Key words Andrew Dobson - deliberative democracy - futuregenerations - political representation. The author is in philosophy, Norwegian University of Science and Technology, Trondheim, Norway. (JAEE)

Ekins, Paul, "Criticism Beyond Measure: Reply to David Fleming's Review of Wealth Beyond Measure by Paul Ekins, Mayer Hillman & Robert Hutchison in Environmental Values, Vol.1 No.3. Autumn 1992." Environmental Values Vol.2 No.1(1993):73-75. ABSTRACT: Fleming's critique of Wealth Beyond Measure (WBM) is wide-ranging. It alleges, inter alia, that the authors prefer "to come out of the corner with fists flying" rather than "to be accurate or to work out careful, rigorous arguments" and that they regard anyone who disagrees with them as "not just wrong but villainous with it." They are also characterized as the purveyors of "pure dream-world stuff." Fleming's assertions on which he bases these statements are that: There are "failures to set out clear explanations" of important topics. It gives "a parody" rather than "a coherent critique of the treatment of environmental issues by mainstream economics." The book "is full of inconsistencies" and "continually contradicts itself." Radical proposals for economic change are frequently unjustified. Unfortunately, as we shall now show, the examples that Fleming gives of these shortcomings are either inaccurate or wholly unconvincing. Department of Economics, Birkbeck College, Gresse Street, London W1P 1 PA, UK.

Ekins, Paul, Review of: Clive Spash, Greenhouse Economics: Values and Ethics, Environmental Values 15(2006):119-121.

ElBala (El Bala), Rodrigue, and Michel Marie," Animal Welfare Considerations in Small Ruminant Breeding Specifications," Journal of Agricultural and Environmental Ethics 19(2006):91-102. After satisfying their quantitative and qualitative needs as regards nutrition, consumers in developed countries are becoming more involved in the ethical aspects of food production, especially when it relates to animal products. Social demands for respecting animal welfare in housing systems are increasing rapidly, as is social awareness of human responsibility towards farm animals. Many studies have been conducted on animal welfare measurement in different production systems, but the available information for small ruminants remains insufficient. In this study, a 75 criteria-evaluation tool has been set up on the basis of the five freedoms concept. Animal welfare considerations have been analyzed in 25 documents, including labeling schemes, regulations, and recommendations from different European countries. The results show many differences between regular and organic small ruminant farming standards. Emergency measures are generally lacking. A weak representation of psychological aspects of animal welfare, especially by the current European legislation, is highlighted. Keywords: animal welfare - small ruminants - indicators - regulations - specifications. The authors are with Sciences Animales, Vandoeuvre lès Nancy, France. (JAEE)

Elbers, Joan S., Changing Wilderness Values 1930-1990: An Annotated Bibliography. Westport, CT: Greenwood Press, 1991. 160 pages. \$ 45.00!! 324 well-annotated entries on the literature and research that shifted American attitudes toward wilderness so dramatically in the course of this century. Elbers finds that this quest, far from being peripheral, has become "the central problem of modern civilization: How to live with restraint and respect for other life and natural ecosystems in a time when human numbers and technological power have made our species a geological force" (preface). Santa Barbara, CA: ABC-CLIO, 2002. Earth's extraordinary diversity of life and the unprecedented threats it faces. 200 A-Z articles, four major overview essays. Eldredge, at the American Museum of Natural History, is the author of numerous works on biodiversity and evolution. (v.13,#1)

Eldredge, Niles. Dominion. New York: Henry Holt, 1995. \$ 25.00. A clearer understanding of our long evolutionary history can help us understand better who we humans are. Agriculture was a critical turning point, about 10,000 years ago, leading humans to believe that they could "step out of" local ecosystems and manage or dominate nature in human interests. Humans came to believe that they could escape the ecological laws of the planet established through many millennia of evolution. This view has gone unchallenged for 10,000 years and has now led us to the brink of ecological disaster. "Now we can see the beginnings of serious, lasting threats--to the global system, to ourselves--if the same course is pursued for much longer." "We have, at best, a few decades to a century to change our course." Eldredge is an invertebrate paleontologist at the New York Museum of Natural History. (v7, #3)

Ellen is in anthropology and human ecology, University of Canterbury, Kent. Fukui is in anthropology, Kyoto University, Japan. (v.13,#1)

Elling, Bo. *Rationality and the Environment: Decision Making in Environmental Politics and Assessment*. London: Earthscan Publications, 2008. Political decision-making frameworks for environmental assessment have important ethical and aesthetic dimensions but usually lack the tools to provide guidance based on these dimensions. Drawing from a Habermasian trisection of rationality as cognitive-instrumental, moral-practical, and aesthetic-expressive, Elling argues that ethical and aesthetic dimensions can only be brought into environmental politics, assessment, and policies by public participation. Citizen involvement can counteract the dictatorship of technical and economic instrumentality in environmental policy.

Ellingsen, Guro M. Havrevold, Gull eller grønne skoger (Gold or Green Forests). M.A. thesis in the Department of the History of Ideas, University of Oslo. The question of a naturalized environmental ethics versus an economically oriented ethic. She is particularly concerned with the use of evolutionary and ecology theory in contrast to economic theory in formulating an ethic. (Norway)

Elliot, Robert, "Rawlsian Justice and Nonhuman Animals", Journal of Applied Philosophy, 1 (1984): 94-105. (Abstract based on abstract in Philosopher's Index) In his book "A theory of Justice", John Rawls argues against the inclusion of non-human animals within the scope of the principles of justice developed therein. However, the reasons Rawls and certain commentators, have advanced in support of this view do not adequately support it. Against Rawls' view that "we are not required to give strict justice" to creatures lacking the capacity for a sense of justice, it is initially argued that (1) "De facto" inclusion should be accorded non-human animals since their exclusion strains just institutions, and (2) Rawls' account of the sense of justice has implicit and undefended human chauvinist elements. Two further counter-arguments are then developed in more detail. It is then claimed that there are no good reasons for disallowing the possibility that non-human animals in the real world would be participants in the original position. If this claim is sound, animals are brought directly within the scope of Rawlsian principles of justice.

Elliot, Robert and Arran Gare, eds., Environmental Philosophy: A Collection of Readings. University Park, Pa.: University of Pennsylvania, 1983. Pp. xiv, 303. The best collection of original essays in environmental ethics. The essays are placed in three groups: the environment and human interests, the development of a new environmental ethic, and the historical traditions regarding the environment. Although the essays in the middle group are more foundational, the essays in Part I are more provocative because they cover ground often ignored by "eco-philosophers." In "Ethical Principles for Environmental Protection," (pp. 3-20), Robert Goodin offers a set of principles that can limit the traditional maximization of net-utility in cost-benefit analysis: Actions should be biased against irreversibility; the

most vulnerable parties and interests should receive particular attention; sustainable policies should be promoted; actions should avoid harm. In "On Deep Versus Shallow Theories of Environmental Pollution," (pp. 58-84), C. A. Hooker extends the criticism of cost-benefit analysis by arguing that it is an "incremental" approach to holistic problems. Without a "vision of life," a collective ideal of the good for society as a whole, environmental problems will be "systematically misposed." Janna L. Thompson, "Preservation of Wilderness and the Good Life," (pp. 85-105), attempts a compromise between preservation arguments based on human interests and those based on the intrinsic value of natural objects. Utilizing the social critique of Marcuse, she proposes a society in which "human self-realization and happiness" arises out of a harmonious working with natural processes as they exist in themselves. Wilderness is not an instrument for humans, but a self-regulating system analogous to a human subject. Part II contains articles by Holmes Rolston, III, "Are Values in Nature Subjective or Objective," (pp. 135-165), criticizing the fact/value distinction in environmental ethics; Mary Midgely, "Duties Concerning Islands," (pp. 166-181), a critique of contractarian "rights" terminology and a broadening of our sense of duty; and Stephen R. L. Clark, "Gaia and the Forms of Life," (pp. 182-197), a call for an extreme "holistic" vision of the self and the obligations to the planetary ecosystem. There are also articles by Gregory S. Kavka and Virginia Warren, Jan Narveson, Mary Anne Warren, Robin Attfield, J. Baird Callicott, and Richard Routley. Extensive bibliography. (Katz, Bibl # 1)

Elliot, Robert, "Environmental Degradation, Vandalism and the Aesthetic Object Argument," Australian Journal of Philosophy 67(1989):191-204. Environmental degradation is wrong, among other reasons, because "the natural environment possesses aesthetic value and its despoliation, or even modification, destroys or diminishes that value." This involves "the claim that what has aesthetic value has intrinsic moral value." Elliot defends this position against John Passmore's argument that environmental degradation is wrong because it involves vandalism and Thomas Hill, Jr., suggestion that the degradation is wrong because it violates ideals of human excellence. "A plausible account of intrinsic moral value, which does not construe it as objective and marks it off from merely valuing something for its own sake, permits explanations of the wrongness of environmental degradation in addition to ones couched solely in terms of ideals of human excellence. Accounts of the latter kind offer a distorted perspective on such cases." Elliot is professor of philosophy at the University of New England, Armidale, Australia and contact person for ISEE in Australia and New Zealand. (v1,#4)

Elliot, Robert, "Intrinsic Value, Naturalness and Environmental Obligation", The Monist, 75 (1992): 138-60. It is argued that wild nature has intrinsic value, which gives rise to obligations both to preserve it and to restore it. An account of intrinsic value, which permits core environmentalist claims, is outlined and defended. A thing has intrinsic value when its value-adding properties outweigh its value-subtracting properties. Value-adding properties may include complex properties and need not be intrinsic - they may be relational. Connections between intrinsic value and obligation are discussed. It is argued that wild nature has intrinsic value, in part, in virtue of its naturalness. Naturalness, it is claimed, is a significant value-adding property, thus supporting the claim that there are obligations to preserve and restore wild nature.

Elliot, Robert, "Ecology and the Ethics of Environmental Restoration", Philosophy, Supplement 36 (1994): 31-43. Some people think that nature has intrinsic value, some people think that nature's intrinsic value grounds an obligation to preserve it and to minimise human interference with it. This is the view the author defends. A distinction is made between non-anthropocentric meta-ethics, which the author suggests is not possible, and non-anthropocentric normative ethics, which is. Williams questions how the normative shift away from the narrowly anthropocentric might be achieved in those who are initially disinclined to perceive intrinsic value in nature. The author suggests that the otherness of projective nature is in concert with its positive aesthetic worth is the significant basis of its intrinsic value. This view is defended against some apparently contrary claims of some restoration ecologists.

Elliot, Robert, "The Rights of Future People." Journal of Applied Philosophy 6 (1989): 159-169. Attempt to unravel some of the puzzles involving the attribution of rights to future non-existent people. Elliot separates the existence of the rights from the existence of the people. We do "not have to claim that the future person is the present bearer of the right...[T]here is no present bearer of the right but...the right exists now" (p. 161). The existence of the right in the present constrains our actions regarding future people, regardless of who these people are. Any cogent view of moral obligation to future generations must address Derek Parfit's problems with future identity; Elliot here fails to mention Parfit, but he raises many of the same issues. (Katz, Bibl # 2)

Elliot, Robert, "Critical Notice of H. McCloskey Environmental Ethics and Politics and R. Attfield The Ethics of Environmental Concern", Australasian Journal of Philosophy, 63 (1985), 499-508.

Elliot, Robert, "Libertarian Justice, Locke's Proviso and Future Generations", Journal of Applied Philosophy, 3, (1986): 217-27. Libertarian justice might plausibly be thought to generate only minimal obligations on the part of present people toward future generations. This is not so, at least on Nozick's version of libertarian justice. Nozickian justice generates extensive obligations to future people. This provides an indirect argument for environmentalist policies such as resource conservation and wilderness preservation. The basis for these obligations is Nozick's use of Locke's proviso, which is spelled out using the notion of the baseline. This paper explains how the extensive obligations are implied by the core ideas of Nozickian justice. There is also a discussion of some of the difficulties involved in understanding the notion of the baseline. However, these difficulties do not destroy the theoretical basis for obligations to future generations contained within Nozickian justice. Provided that libertarian justice involves some such device as Locke's proviso the enforcement of substantial environmentalist policies comes within the ambit of the libertarian minimal state.

Elliot, Robert, "Regan on the Sorts of Beings that Can Have Rights", Southern Journal of Philosophy, 16 (1978): 701-5. According to Joel Feinberg neither plants nor "mere things" can have rights. This seems plausible but Tom Regan has criticised the arguments Feinberg offers in support of his view. Feinberg appeals to two principles to distinguish between those beings that can, and cannot, have rights - the interest principle (only beings who have interests can have rights) and the goodness principle (a right-holder must have a good of its own). The author draws on a distinction between a thing being good and its having a good of its own to defend Feinberg's view against Regan's criticism. Mere things are not included by the goodness principle among the sorts of beings that can have rights. Something that lacks sentience cannot have a good of its own, therefore it cannot have rights.

Elliot, Robert, "Review of "S.R.L. Clark, The Nature of the Beast, and Bernard Rollin, Animal Rights and Human Morality", Australasian Journal of Philosophy, 61 (1983): 454-56.

Elliot, Robert, "Introduction", R. Elliot and A. Gare, eds., Environmental Philosophy: A Collection of Readings, St. Lucia, University of Queensland Press, 1983, ix-xiv. Concern for present and future human beings should be sufficient motivation for calling into question our relationship with the natural environment and modifying our attitudes to it. There are other reasons as well. Our policies threaten nonhuman animal populations. Certain policies may be condemned not just because they harm human beings or nonhuman animals but because they threaten parts of the natural environment. An environmental ethic may be thought of as a systematic ethic which allows moral concern for future generations, nonhuman animals and nonsentient nature. What is significant is that an environmental ethic represents a decided shift from traditional ethics which place human beings at the centre of the moral universe to an ethic of much wider scope. This collection of papers represents the efforts of philosophers to comprehend and respond to the environmental crisis. The papers are divided into three parts: Environmental policy and human welfare, A new environmental ethic? and Attitudes to the natural environment.

Elliot, Robert, "Future Generations, Locke's Proviso and Libertarian Justice." Journal of Applied Philosophy 3, no. 2 (1986): 217-227. A defense of Robert Nozick's version of libertarian justice applied to obligations to future generations. If Locke's proviso regarding just acquisitions (that "enough and as good be left for others") is taken seriously, then environmental obligations to future generations can be maintained. (Katz, Bibl # 1)

Elliot, Robert, "Review of C.C.W. Taylor Ethics and the Environment, Australasian Journal of Philosophy, 72 (1994): 262-63.

Elliot Robert, "Faking Nature", Inquiry, 25 (1982): 81-93. Environmentalists express concern at the destruction/exploitation of areas of the natural environment because they believe that those areas are of intrinsic value. An emerging response is to argue that natural areas may have their value restored by means of the techniques of environmental engineering. It is then claimed that the concern of environmentalists is irrational, merely emotional or even straightforwardly selfish. This essay argues that there is a dimension of value attaching to the natural environment which cannot be restored no matter how technologically proficient environmental engineers become. The argument involves highlighting and discussing analogies between faking art and faking nature. The pivot of the argument is that claim that genesis is a significant determinant of an area's value.

Elliot, Robert, "Environmental Ethics", in P. Singer, ed., A Companion to Ethics, Oxford, Blackwell, 1991, 284-93. This article describes a variety of environmental ethics from the anthropocentric to the holistic. It highlights relationships between them and reviews the arguments which might be used to justify them.

Elliot, Robert, "Extinction, Restoration, Naturalness", Environmental Ethics, 16, (1994): 135-144. Alastair S. Gunn has argued that it is in principle possible to restore degraded natural environments and to restore their full value, provided that species distinctive to them are extant. It is argued, first, that the proviso is unnecessary. More importantly, it is claimed that full value cannot be restored because restored environments lack the relational property of being naturally evolved. Elliot delineates and explains the structure and detail of the theoretical bases for this claim and shows that Gunn's reflections do not rule out the view that full value cannot be restored.

Elliot, Robert, "In Defence of the Vegetarian Argument", Applied Animal Ethology, (1981): 190-96. Lehman and Hurnik have attempted to undermine the moral basis for vegetarianism. The author claims that their arguments to this end are defective. When the vegetarian argument used by Regan and Rachels is correctly understood, Lehman and Hurnik's objections have no weight.

Elliot, Robert, "Moral Autonomy, Self-Determination and Animal Rights", The Monist, 70 (1987): 83-97. It has been argued that nonhuman animals do not, because they cannot, possess moral rights because they lack rational autonomy and a capacity for moral self-determination. Elliot refutes these arguments in two of their recent forms and suggests that nonhuman animals possess that degree of autonomy which is necessary for the coherent ascription of moral rights to them.

Elliot, Robert, Review of Sylvan, Richard, Bennett, David, The Greening of Ethics. Environmental Values 5(1996):273-274. (EV)

Elliot, Robert, "Review of Holmes Rolston III Philosophy Gone Wild", Canadian Philosophical Reviews, 7 (1987), 319-22.

Elliot, Robert, "Extinction, Restoration, Naturalness." Environmental Ethics 16(1994):135-144. Alastair S. Gunn has argued that it is in principle possible to restore degraded natural environments and to restore

their full value, provided that species distinctive to them are extant. I argue, first, that the proviso is unnecessary. More importantly, I claim that full value cannot be restored because restored environments lack the relational property of being naturally evolved. I delineate and explain the structure and detail of the theoretical bases for this claim and show that Gunn's reflections do not rule out the view that full value cannot be restored. Elliot is in philosophy at the University of New England, Armidale, Australia. (EE)

Elliot, Robert, "Introduction", in R. Elliot, ed., Environmental Ethics, Oxford, Oxford University Press, 1995, 1-20. Prudence and a concern for other humans, including future humans is sufficient to motivate unease about human modifications to the natural environment. Self-interest and morality, evidenced in beliefs about the rights of, and duties and obligations towards, other humans, combine to persuade many people that modifications of the natural environment should at the very least be scaled down. The author goes on to describe different human-centred ethics. But not all who advocate environmentalist policies are moved by human-centred reasons alone and some might regard these reasons as comparatively insignificant. This view, they claim, it to exhibit an unjustified human chauvinism. The extent to which moral concern is extended to include beings other than humans is discussed. Next, the nature of competing environmental ethics is examined (by drawing on the distinction between the terms "moral considerability" and "moral significance"), and the meta-ethical and metaphysical aspects of environmental ethics are identified.

Elliot, Robert Faking Nature: the Ethics of Environmental Restoration, Routledge, London and New York, xii, 177. This book is a development of the view first outlined in Elliot's 1982 Inquiry article, "Faking Nature". Although the present account revises certain aspects of the earlier account it maintains the earlier claims that natural value cannot be restored and that naturalness is a basis for intrinsic moral value. These claims are developed in the context of a theory of value which is both subjectivist and nonanthropocentric. The book takes into account criticisms of the earlier article, particularly those of Richard Sylvan and various restoration ecologists. The chapter titles, indicative of the content are, "The nature of natural value", "Environmental obligation, aesthetic value, and the basis of natural value", "Faking nature", and "Naturalness, intrinsic value and restoration ecology." Elliot is at Sunshine Coast University College, Maroochydore South, Queensland, Australia. (v9,#1)

Elliot, Robert, "The Rights of Future People", Journal of Applied Philosophy, 6 (1989): 159-69. It has been argued by some that the present non-existence of future persons entails that whatever obligations we have towards them are not based on rights which they have or might come to have. This view is refuted. It is argued that the present non-existence of future persons is no impediment to the attribution of rights to them. It is also argued that, even if the present non-existence of future persons were an impediment to the attribution of rights to them, the rights they will have when they come into existence constitute a constraint on present actions. Next three arguments are considered which, while they do not highlight the non-existence issue, are related to it. The view that the causal dependence, of (some) future people on present policies, erodes or weakens the claim that rights considerations should constrain our present actions concerning them; the view that future people can only have rights to what is available at the time at which these people come into existence; and the view that the attribution of rights to future people involves, in virtue of resource scarcity, an unacceptable arbitrariness. All three are rejected.

Elliot, Robert, "Review of Holmes Rolston III Environmental Ethics", Australasian Journal of Philosophy, 67 (1989): 493-94.

Elliot, Robert, "The Value of Wild Nature", Inquiry, 26 (1983):359-61. Don Mannison levels three criticisms at the claims Elliot makes in "Faking Nature". First, he claims that Elliot argues from (1) "x is valued" to (2) "x has value". Elliot denies this. Second, Mannison criticises an argument of Nelson Goodman's to which Elliot alludes. While the criticism has point, Elliot claims that Mannison

misrepresents the role he (Elliot) assigns to Goodman's argument. Third, Mannison suggests that there is no need for Elliot to count environmental evaluations as evaluations of the moral kind. However, he offers no account of why he should not and ignores an important consideration that requires that he should.

Elliot, Robert, "Facts About Natural Values," Environmental Values 5(1996)221-234. Some environmental philosophers believe that the rejection of anthropocentric ethics requires the development and defence of an objectivist meta-ethical theory according to which values are, in the most literal sense, discovered not conferred. It is argued that nothing of normative or motivational import, however, turns on the meta-ethical issue. It is also argued that a rejection of normative anthropocentrism is completely consistent with meta-ethical subjectivism. Moreover the dynamics and outcomes of rational debate about normative environmental ethics are not determined by any particular choice between meta-ethical subjectivism and objectivism. These different meta-ethical views sustain analogous moves in normative debate, although they offer rather different accounts of what underlies these moves. They also provide for analogous links between moral belief and motivation, although again they offer rather different accounts of what underlies these links. In the course of defending these conclusions a subjectivist account of intrinsic value is developed and defended. KEYWORDS: Anthropocentrism, environmental ethics, meta-ethics, value-theory

Elliot, Robert, "Meta-Ethics and Environmental Ethics", Metaphilosophy, 16 (1985): 103-17. It has been argued by some that an environmental ethic is possible only if meta-ethical objectivism is true. However, there are good reasons for thinking that it is not true. It turns out that an environmental ethic is compatible with a non-objectivist meta-ethic. A subjectivist meta-ethic is outlined and is shown to provide conceptual space for the claims of an environmental ethic.

Elliot, Robert, "Reply to William Godfrey-Smith", in D. Mannison, M. McRobbie and R. Routley, eds., Environmental Philosophy, Canberra: Research School of Social Sciences, Australian National University, 1980, 48-51. William Godfrey-Smith is now William Grey. It is agreed that the moral community can be justifiably extended to include sentient non-humans, however, it is claimed that it is possible to give up human chauvinism without adopting the ethic Godfrey-Smith advocates. Feinberg's interest principle is taken by Godfrey-Smith to be the most promising for demarcating the class of individuals to whom rights can be properly attributed. It is claimed that this principle does not force an extension of the class of rights-holders beyond the class of sentient individuals, as claimed by Godfrey-Smith, to include individual trees, rainforests, soils and whole species. The crucial difference, it is claimed, is that sentient individuals but not plants are the subjects of experience. It is claimed that Godfrey-Smith has not provided sufficient argument to force an extension of the class of right-bearers in the way he advocates. Godfrey-Smith opposes the view that all values are grounded in human interest and concern, however, it is not necessary to accept his conclusion in order to argue against this position. Finally, it is not clear that he has produced an argument that shows there is no dependence between value and valuers analogous to the dependence between, say, lies and liars.

Elliot, Robert, "Environmental Degradation, Vandalism and the Aesthetic Object Argument", Australasian Journal of Philosophy, 67 (1989): 191-204. It is argued that the natural environment has intrinsic moral value because it has aesthetic value. It is argued that its having intrinsic moral value generates a prima facie obligation to preserve and protect it. Two aesthetic object arguments are examined: The first argument against environmental degradation makes a direct connection between aesthetic value and intrinsic moral value - what has aesthetic value has intrinsic moral value. The second is not so conjoined, and requires supplementing in order to demonstrate that there is a moral reason for not degrading the natural environment. It is argued that the second argument does not provide an independently strong argument against environmental despoliation. The problem lies in identifying a basis for a condemnation of despoliation which does not appeal either to instrumental reasons nor the

intrinsic value of nature. The first aesthetic object argument, on the other hand, is plausible, coherent and compelling. Elliot claims it can be defended against the normative, metaphysical and meta-ethical arguments brought against it.

Elliot, Robert, "Why Preserve Species?" in D. Mannison, M. McRobbie and R. Routley, eds., Environmental Philosophy, Canberra: Research School of Social Sciences, Australian National University, 1980, 8-29. Environmentalists frequently urge restraints on human activity because that activity threatens the existence of some species or other. The author aims to find out how much strength there is in the argument that it is wrong, or at least prima facie wrong, to destroy species. The question is whether there is any value in species preservation over and above the consequences species preservation has for individual members of species. That species preservation is instrumentally valuable, the aesthetic object argument, and the intrinsic value of species preservation, as well as the claimed need for a new environmental ethic are considered.

Elliot, Robert. "Instrumental Value in Nature as a Basis for the Intrinsic Value of Nature as a Whole." Environmental Ethics 27 (2005):43-56. Some environmental ethicists believe that nature as whole has intrinsic value. One reason they do is because they are struck by the extent to which nature and natural processes give rise to so much that has intrinsic value. The underlying thought is that the value-producing work that nature performs, its instrumentality, imbues nature with a value that is more than merely instrumental. This inference, from instrumental value to a noninstrumental value (such as intrinsic value or systemic value), has been criticized. After all, it seems to rely on the bizarre idea that a thing's instrumental value could be a basis for its intrinsic value. This idea, however, is not as easy to dismiss as many might think. Review of the obvious arguments that might be deployed to defeat it shows that they have to be rejected, suggesting that a thing's instrumental value could be, and arguably is, a basis for its intrinsic value. Defending this apparently bizarre idea provides a way of justifying the claim that nature as a whole has intrinsic value. (EE)

Elliot, Robert. Faking Nature: The Ethics of Environmental Restoration. Reviewed in Environmental Ethics 21(1999):329-332.

Elliot, Robert. Faking Nature: The Ethics of Environmental Restoration. Review by Eric Katz, Ethics and the Environment 3(1998):201-205.

Elliot, Wayne. "Wilderness in the New South Africa." International Journal of Wilderness 2, no. 2 (August 1996): 9-13. South Africa is redefining itself in the post-apartheid era. Currently eleven wilderness areas are protected by law. The principal challenges lie in developing uniform wilderness management standards, legislating a wilderness act, and enabling local communities such as those that exist in KwaZulu/Natal to manage and receive direct benefit from their adjacent wildlands. Elliot heads conservation in the Department of Nature Conservation, KawZulu/Natal, South Africa, and has been influential in incorporating blacks into wildlife conservation there. (v7, #3)

Elliott, Craig, "New Frontiers: Thermal Pools May Hold Many Secrets," Wilderness Profile (Newsletter of the Yellowstone Association), 13 (no. 1, Spring 1998):1-4. Bioprospecting in Yellowstone National Park. Park authorities have now set a policy that scientific research without expectation of commercial results is free, but that research in expectation of commercial results must enter into a "shared benefits contract," by which the park will receive a set amount of cash and a percentage of royalties from any future successful applications resulting from the research. There is great interest the thermophiles, especially since Thermus aquaticus, or "tac" was used to develop the polymerase chain reaction, a process worth many millions of dollars. (v9,#1)

Elliott, Herschel, *Ethics for a Finite World: An Essay Concerning a Sustainable Future*. Fulcrum

Publishing, Golden, CO, 2005. Humans need a finite ethics, "a steady-state ethics" (p. xxvi). Since we humans evolved on the planet, we have been pushing back limits. For millennia humans have lived with a deep-seated belief that life will get better, that one should hope for abundance, and work toward obtaining it. We have in the West built that into our concept of human rights: a right to self-development, to self-realization. The egalitarian ethic is wrong, because it scales everybody up and drives an unsustainable world. The ethic of "human rights," of a right to food, to development, to education, to employment, a right to reproduction is, in this sense, pushing in the wrong direction. Asserting such rights is contributing to life-system breakdown (Chapter 2; cf. pp. 74-75). Elliott is a retired professional philosopher, now a vegetarian farmer in remote Vermont, living without utilities and indoor plumbing, eating mostly what he grows and stores.

Elliott, Kevin. "Norton's Conception of Sustainability: Political, Not Metaphysical." *Environmental Ethics* 29(2007):3-22. In his new book, *Sustainability: A Philosophy of Adaptive Ecosystem Management*, Bryan G. Norton proposes an account of sustainability grounded in the deliberation of local communities as part of an adaptive management process. One can distinguish two different ways of justifying his account - resulting in "political" and "metaphysical" conceptions of sustainability - in much the same way that John Rawls famously distinguishes between political and metaphysical conceptions of justice. Whereas the metaphysical conception of sustainability depends on principles that are specific to American pragmatist philosophical theory, the political conception draws on relatively uncontroversial elements of democratic political culture. Although Norton seems to lean toward a metaphysical conception of sustainability in his book, a political conception would actually be more compatible with the overarching aims of his project. Finally, the distinction between political and metaphysical conceptions could prove valuable as a model for thinking about how many of the current projects in environmental pragmatism relate to other strands of environmental philosophy. Thus, a potentially fruitful alteration to Norton's recent work provides some conciliatory lessons for relating different projects in the field of environmental philosophy. (EE)

Elliott, Valerie, "400,000 March in London," The Times, September 23, 2002, p. 1, pp. 4-5. 400,000 protesting for fox hunting!?! The biggest peaceful street protest in British history took place September 22 in London, with an estimated 400,000 protestors on behalf of numerous rural concerns, with fox hunting an icon of these concerns. The Liberty and Livelihood March was organized by the Countryside Alliance, hunting horns blaring, but many conceded they were more concerned about making a living from the land regardless of the fate of the foxes.

Ellis, Gerry and Karen Kane, Wilderness Remembered. Minocqua, WI: NorthWord Press, 1995. Excerpts from earlier explorers of the wilderness, their diaries, journals, and other works, often offsetting the belief that such explorers found a howling wilderness that they feared or disliked. Accompanied by contemporary photographs. (v7,#1)

Ellis, Joy. "Drafting from an Overdrawn Account: Continuing Water Diversions from the Mainstem Columbia and Snake Rivers." Environmental Law 26, no.1 (1996): 299. Ellis analyzes restrictions on diversions of mainstream Columbia River flows in Washington, Oregon, and Idaho. She concludes that, while the moratoria recently imposed by the three states will contribute to the recovery of threatened and endangered salmon species, state agencies must do more to protect instream flow from further water appropriation activity. Ellison, Peter, On Fertile Ground: A Natural History of Human Reproduction. Cambridge, MA: Harvard University Press, 2001. Mounting evidence that the physiological regulation of ovulation, fertilization, implantation, and the maintenance of a pregnancy among humans is particularly specialized to protect high-quality, large-brained offspring. Implantation and nurturance of the human fetus with a haemochorial placenta, which endures a large and consistent supply of nutrients, differ from those in most mammals. Fetal growth is more rapid in humans than in gorillas and chimpanzees. Birth in humans is a treacherous affair, because the pelvis is barely large enough to allow the baby's enormous head to pass through. Natural selection has compromised conflicting demands of female locomotion, brain growth, and birth complications to produce a delicate fitness-maximizing balance.

Human mothers store exceptional amounts of fat, during and after pregnancy, to support an equally exceptional rate of brain growth in the fetus and nursing newborn. These offspring then require a long period of nurture and education into culture. Raising humans requires a massive investment, typically about eighteen years. Ellison is an anthropologist at Harvard University. (v.12,#3)

Elmendorf, Christopher S., "Ideas, Incentives, Gifts, and Governance: Toward Conservation Stewardship of Private Land, in Cultural and Psychological Perspective," University of Illinois Law Review 2003, no. 2, 423-505. Conserving ecological resources on private lands requires both supportive landowners and regulatory coercion, notwithstanding that rural landowners comprise the most consistently anti-environmental demographic group in America. Neither policymakers nor legal scholars have come up with satisfying responses to this predicament. One needs incentives, gifts, governance, and, above all, more ideas. Long law article with many citations. Elmendorf is Law Clerk, U.S. Court of Appeals for the Second Circuit, and University of California, Davis, School of Law.

Eldson, Ron. Bent World: A Christian Response to the Environmental Crisis. Reviewed in Environmental Ethics 4(1982):359-62.

Elvey, Anne, "Beyond Culture? Nature/Culture Dualism and the Christian Otherworldly," Ethics and the Environment 11(2006):63-84. As Val Plumwood argues, the Christian otherworldly is ecologically problematic. In relation to time, space, being and agency, this article considers the tendency to dualism in Christian appeals to the otherworldly. In the context of Plumwood's critique of nature-skepticism, I ask whether we should also critique an otherworldly skepticism. I then set out five possibilities for understanding the Christian otherworldly in relation to nature and culture. I argue that the otherworldly can be understood not only as a problematic cultural notion that participates in the devaluation of nature, but as a way of understanding the otherness of nature, as having purposes and agencies beyond the cultural construction of earth as world. An understanding of nature as other-worldly presents challenges for both Christian theologies and environmental ethics. Elvey is director of research administration, Melbourne College of Divinity, Australia. (Eth&Env)

Ends and Means is a journal of philosophy and technology published twice yearly by the Centre for Philosophy, Technology and Society at the University of Aberdeen. The journal is devoted to rigorous philosophical exploration of social, moral and conceptual questions arising in relation to technology. Although not committed to any one school or style of philosophy, its editorial policy is to publish only material of high philosophical quality written in a style accessible to a wide readership. Contributions should not exceed 7500 words, though shorter articles and discussions are especially welcome. Two copies of a typescript should be submitted to: Dr. Jonathan Friday, Centre for Philosophy Technology and Society, University of Aberdeen, Aberdeen, SCOTLAND, AB24 3UB. Alternatively texts may be submitted by email to Friday@abdn.ac.uk. For more information visit the Centre's web-page at www.abdn.ac.ukat. (v.12,#2)

Enserink, Martin, "Tiptoeing Around Pandora's Box," Science 305(30 July, 2004):594-595. Avian flu in Asia is one of the worst animal-health outbreaks in history. [See Altman, Lawrence K., "Avian Flu Kills 1,500 Ostriches on 2 South Africa Farms," New York Times, August 10, 2004, p. D4]. Two hundred million birds have been culled in Asia this year. The virus is very similar to human influenza and researchers fear a crossover that would create a highly lethal human epidemic. They could do this in the labs and test the likelihood of an epidemic, promoted by the World Health Organization. But how likely is it that the hybrid might escape the labs--recalling that the SARS virus escaped from three Asian labs in the past year? Researchers think that present drugs would kill the new virus, but they do not know how

likely an epidemic would be, probably in areas with few drugs to control it. (v. 15, # 3)

Enserink, Martin and Vogel, Gretchen, "The Carnivore Comeback," Science 314(3 November 2006):746-749. Bears, wolves, lynx, and wolverines, once nearly exterminated from Western Europe, have been making a comeback--both by reintroducing themselves from Eastern Europe, now that the fences are down, and by restoration biology. And there are plenty of protests, especially from farmers whose sheep are killed. Wolves and bears are in almost every country in Europe.

Environment Yale. The Journal of the School of Forestry and Environmental Studies Vol. 6, no. 2 (Fall 2007). This book contains discussions of bioenergy, cap and trade control of CO₂, the emerging alliance of religion and ecology, and conservation economy in indigenous culture in Australia.

Environmental and Architectural Phenomenology. The winter 1992 issue marks the start of this multidisciplinary newsletter's third year. This issue focuses on "place and place experience" and includes book reviews and poetry as well as essays by composer R. Murray Schafer, philosopher Antony Weston, and geographers Edward Relph and J. Douglas Porteous. The theme of the spring 1992 issue is "phenomenology and environmental ethics." Contributors include naturalist Paul Krapfel and philosophers Ralph R. Acampora, Joseph Grange, and Jeffrey Wattles. Annual subscription \$ 6 (\$ 8 foreign). Contact: Dr. David Seamon: Architecture Department, Seaton 211, Kansas State University, Manhattan, KS 66506. (v2,#4)

Environmental and Architectural Phenomenology Newsletter, Winter 97, focuses on Goethean science, which can be described as an implicit phenomenology of nature and the natural world. Though best known as one of the world's great poets and playwrights, Johann Wolfgang von Goethe (1749-1832) also developed a qualitative style of science that drew on firsthand experience of particular phenomena. Goethe's own scientific work focused on plants and the nature of light and color. Recent work by others has examined such topics as the nature of water, animal form, and the built environment. This issue of the EAP Newsletter includes an essay by ecologist Mark Riegner on the relationship between Goethe and deep ecology, and reviews of two recent books on Goethean science. The EAP Newsletter is published three times annually and a subscription is \$10. For a free sample copy or to subscribe, contact the Editor: David Seamon, Architecture Department, 211 Seaton Hall, Kansas State University, Manhattan, KS 66506-2901; Tel: 785-532-1211. (v.8,#4)

Environmental and Architectural Phenomenology Newsletter, The. has recently been launched as a forum and clearing house for research and design that incorporates a qualitative approach to environmental and architectural experience. A key concern is design, education, and policy supporting and enhancing natural and built environments that are beautiful, alive, and humane. The newsletter is interested in the sense of place, of home, of environmental encounter and its relation to environmental ethics, responsibility, and action. There will be three issues each year. Contact David Seamon, Department of Architecture, College of Architecture and Design, Kansas State University, Manhattan, KS 66506. (v1,#2)

Environmental Careers Organization. The Complete Guide to Environmental Careers in the 21st Century. Covelo, CA: Island Press, 1999. 280 pp. \$39.95 cloth. \$17.95 paper. The entire spectrum of environmental career fields. Individual chapters provide an "at a glance" summary of a field; discuss its history and background along with current issues and trends. Specific career opportunities and their educational requirements; salary ranges by type of employer, level of experience, and responsibility. (v.10,#1)

Environmental Challenges to Modern Society. Theme issues of Socijalna Ekologija: Casopis za ekolosku misao i sociologijska istrazivanja okoline (Social Ecology: Journal for Environmental Thought and Sociological Research) vol. 5, no. 3 (1996). Published in Zagreb, Croatia, in Croatian. Articles on sustainability, environmental education, waste, ontological and ethical perspectives on environmental protection and ecology, the Croatian strategy of environmental education in the church and at school. (v8,#3)

Environmental Conservation is an international journal devoted to maintaining global viability through exposing and countering environmental deterioration resulting from human population pressure and unwise technology. Now in its eighteenth year, it is published quarterly for the Foundation for Environmental Conservation, in Lausanne, Switzerland, with the collaboration of the United Nations Environment Programme (UNEP), the International Union for the Conservation of Nature and Natural Resources (IUCN), the International Association for Ecology (INTECOL), the International Society of Naturalists (INSONA), the International Conferences on Environmental Future (IECFs), the World Council for the Biosphere-International Society for Environmental Education (WCB-ISEE) and the World Wide Fund for Nature (WWF). (v2,#1)

Environmental Crimes at the Rocky Flats Nuclear Weapons Facility. Hearings Vol. I. U. S. Subcommittee on Investigation and Oversight, Committee on Science, Space, and Technology. 1,700 pages (!) of testimony before this House Committee concerning Rockwell Corporations management of Rocky Flats, a nuclear weapons facility in Colorado. Government documents, call no: Y4.SCI 2:no. 102/163DOC. (v4,#2)

Environmental Education Research is a new academic journal, issued three times a year, devoted to advancing environmental education through a focus on papers reporting research activities. The journal expects to publish papers on policy issues, comparative environmental education, and critical reviews of environmental education. Sample papers from vol. 1, no. 1, 1995: John Fein, "Teaching for a Sustainable World: The Environmental and Development Education Project for Teacher Education"; Barcia Marentic Pozarnik, "Probing into Pupil's Moral Judgement in Environmental Dilemmas: A Basis for 'Teaching' Values"; Elena Camino and Carla Calcagno, "An Interactive Methodology for 'Empowering' Students to Deal with Controversial Environmental Problems." Address inquiries to Chris Oulton, Environmental Education Research, School of Education, University of Bath, Bath BA2 7AY, U.K. (v6,#3)

Environmental Enhancement Through Agriculture. Agriculture can serve the environment rather than conflict with it. 36 papers offering numerous examples of agricultural systems that benefit the environment: increasing wildlife habitat and biodiversity; protecting water quality in streams and estuaries; producing substitutes for nonrenewable energy sources; turning urban waste into a resource; offering aesthetically appealing landscapes; and bringing urban residents into closer contact with food production and the land. Special attention to areawide collaborations in which farmers, citizens, and technical experts establish common goals and develop innovative arrangements. From a conference held in Boston, sponsored by the Tufts University School of Nutrition Science and Policy and others. \$20, postpaid, to "Trustees of Tufts College." Center for Agriculture, Food and Environment, School of Nutrition Science and Policy, Tufts University, Medford, MA 02155.

Environmental Grantmaking Foundations, 1993 Directory. Rochester, NY: Environmental Data Research Institute (1655 Elmwood Ave, Suite 225, Rochester, NY 14620-3426. \$ 55. 400 foundations. Indexes by location, activity, emphases, and so forth. (v4,#4)

Environmental Grantmaking Foundations, 5th edition. Rochester, NY: Resources for Global Sustainability, 1997. 1,000 pages. \$ 89.00. 750 foundations, U.S. and Canadian sources of world-wide funding. The most comprehensive source. The first four editions were published by Environmental Data

Research Institute, a related group. There is a CD-Rom version at \$ 104.00 800/724-1857. Fax 716/473-0968. E-mail rgs@eznet.net. Web site: <http://home.eznet.net/~rgs> (v.8,#4)

Environmental Grantmaking Foundations, 1992 Directory. Rochester, NY: Environmental Data Research Institute, 1992. (797 Elmwood Avenue, Rochester, NY 14620) 490 pages, \$ 40. 250 foundations that give environmental grants. (v3,#4)

Environmental Grantmaking Foundations 1993. Rochester, NY: Environmental Data Research Institute (1655 Elmwood Ave., Suite 225, Rochester, NY 14620-3426), 1993. \$ 55.00. 400 foundations, the most significant independent, community, and company-sponsored foundations. These foundations together gave over \$ 350 million for environmental purposes last year. Why foundations make the awards they do. Sample grants. Key personnel. (v4,#3)

Environmental Grantmaking Foundations 1996. Rochester, N.Y.: Environmental Data Research Institute, 1996. 900pp. \$84 softcover. A comprehensive guide to 700 of the most significant independent, community, and company-sponsored foundations that give environmental grants. Each profile gives data to target the most likely sources of support; multiple indexes help to narrow the search. (v8,#1)

Environmental Grantmaking Foundations. 3rd edition, 1995. 600 foundations. Environmental Data Research Institute, 1655 Elmwood Ave., Suite 225, Rochester, NY 14620-3426. \$70. (v6,#1)

Environmental History Review (formerly, Environmental Review). Center for Technology Studies, New Jersey Institute of Technology, Newark, New Jersey 07102. This is the journal of the American Society for Environmental History. As such, it specializes in environmental history and policy studies. Many articles concern the intellectual history of environmentalism. One forthcoming issue (summer 1991) with a focus on "The Moral Sense of Nature," will be devoted to environmental philosophy. (Katz, Bibl # 2)

Environmental Investments: The Costs of a Clean Environment. Report of the Administrator, Environmental Protection Agency. Covelo, CA: Island Press, 1991. \$ 40.00 cloth. 520 pages. What industry should expect in direct costs for implementing pollution control measures and undertaking compliance with environmental laws. The costs of forthcoming and projected environmental programs. An account of the \$ 115 billion per year that the public and private sectors spend on pollution prevention and control. (v2,#3)

Environmental Justice: A Negotiation Training Program. Developed by graduate students at MIT, here are negotiation exercises designed to help groups teach and learn as they negotiate. Case studies: (1) Siting an asphalt plant in the city of Madrona. Six keyholder states must meet to consider how to address equity and fairness claims. (2) The Beaumont Incinerator. What are valid grounds for claims of environmental justice? Impacts and risks concentrated in poor communities, environmental racism. \$ 10 each. Order from: Program on Negotiation Clearinghouse, Harvard Law School, 518 Pound Hall, Cambridge, MA 02138. Phone 617/495-1684. Fax 617/495-7818. (v7,#1)

Environmental Media Association, The. has been founded in Hollywood by producer-director Norman Lear and a cast of major television and movie industry players. Andy Spahn is director and the association tries to use the industry's communication skills to make people more aware of environmental issues. For information contact: Environmental Media Association, 10536 Culver Boulevard, Culver City, CA 90232. Phone 213/559-9334. (v1,#1)

Environmental Philosophy: A Bibliography. The Centre for Philosophy and Public Affairs, University of St. Andrews, Scotland, has published a series of booklets on environmental philosophy commissioned by the U.K. Nature Conservancy Council. One of general interest is this bibliography, 75 pages in length. It

contains a small section of key books and articles, a comprehensive and thematic listing of recent work in environmental ethics, philosophy, and policy, and a description of research centers, societies, and education programs concerned with environmental philosophy. Copies are available at £3.00 within the U.K and the equivalent of £4.00 elsewhere. Orders to Dr. John Haldane, Centre for Philosophy and Public Affairs, University of St. Andrews, St. Andrews, Fife KY16 9AL, Scotland, UK. (v3,#4)

Environmental Planning Professions Interdisciplinary Committee, Poverty and the Environment. Proceedings of the EPPIC '92 Conference (28-29 September 1992, Midrand). 376 pages. EPPIC address: P.O. Box 62041, Marshalltown, 2107, South Africa. Telephone: (27) 11 836 8618. Fax: (27) 11 836 8657). Contains a keynote address, "The Nature of Poverty in South Africa," by Roy Siegfried, Percy Fitzpatrick Institute of Ornithology, University of Cape Town. These proceedings, resulting from the conference, are devoted to the following themes: 1. The Nature of Poverty in South Africa. 2. Economic Realities of Poverty in South Africa. 3. The Impact of Poverty on the Environment. 4. Energy Needs, Poverty and the Environment. 5. Strategies for Environmental Management in South Africa. 6. Environmental Education. 7. What Can The Planning Professions do to Alleviate Poverty and Reduce its Impact on the Environment. 8. Development of Viable Strategies for the Future. (v6,#3)

Environmental Politics, which began publication in the spring of 1992, is proving a lively forum for exchange of ideas, more often than not with implications for environmental ethics. The price (£ 35.00, or \$ 50.00 individuals) may discourage individual subscriptions, but encourage your library to get it (£ 80.00, or \$ 120.00). Also you can get automatic E-mail notice of each issue's contents through the UnCover Reveal service (see above). Editors are Michael Waller and Stephen C. Young, Department of Government, University of Manchester, UK. Published by Frank Cass and Company, Ltd., Gainsborough House, 11 Gainsborough Road, London E11 1RS, UK. The winter 1993 (vol. 2, no. 4) issue is: "Rio: Unravelling the Consequences." (v5,#4)

Environmental Professional, The. The official journal of the National Association of Environmental Professionals, published in cooperation with the Civil Engineering Department at UCLA. Volumes 9:4 (1987) and 10:1 (1988) were dedicated to "Focus on Environmental Ethics." These two issues brought together papers by environmental philosophers, environmental historians, engineers, and policymakers. Eighteen articles are included in the special issues, including essays by Eugene Hargrove, J. Baird Callicott, Holmes Rolston, Paul B. Thompson, Alastair Gunn, John Opie, and Gene Spitzer. These special issues are important because they introduce the work of environmental philosophers to environmental engineers and scientists; for environmental philosophers, standard issues of The Environmental Professional are of central importance for the understanding of policy problems. (Katz, Bibl # 2)

Environmental Values, issue no. 2, is in print. Articles: Bryan Norton, "Sustainability, Human Welfare and Ecosystem Health"; Mary Midgley, "Beasts Versus the Biosphere?"; David Rothenberg, "Individual or Community? Two Approaches to Ecophilosophy in Practice"; Richard B. Howarth, "Intergenerational Justice and the Chain of Obligation"; Brian Furze, "Ecologically Sustainable Rural Development and the Difficulty of Social Change"; Anthony M. Friend, "Economics, Ecology and Sustainable Development: Are They Compatible?" This is the most recently launched journal in environmental ethics and policy. Contact Alan Holland, Lancaster University, Lancaster LA1 4YT, United Kingdom. (v3,#2)

Epstein, Gerald, Julie Graham, and Jessica Nembhardt, eds., Creating a New World Economy. Philadelphia: Temple University Press, 1993. 496 pages. \$ 22.95 paper. \$ 49.94 cloth. Twenty-five economists set out the challenges posed by a global economy. With much reference to environmental conservation. Epstein is an economist at the University of Massachusetts-Amherst, Graham is a geographer there, and Nembhardt specializes in international finances there. (v4,#3)

Erhard, Nancie. *Moral Habitat: Ethos and Agency for the Sake of Earth*. Albany: State University of New York Press, 2007. Erhard explores how moral imaginations and moral norms have been shaped and co-created with Earth in diverse biotic communities. She weaves religion and science with indigenous peoples and womanist traditions and uses examples from sources such as the Old Testament, post-Cartesian science, and the Mi'kmaq tribe of Eastern Canada to develop pluralist accounts of the moral agency of the natural world.

Erhard, Nancie. *Moral Habitat: Ethos and Agency for the Sake of Earth*. Albany: State University of New York Press, 2007. Environmental ethics, featuring "otherkind" and humankind, contributes to our moral imagination. Our moral imaginations and moral norms have been shaped by Earth in diverse biotic communities. Weaving together science and religion with indigenous and womanist traditions, Erhard uses examples from a variety of sources, including post-Cartesian science, the Old Testament, and the Mi'kmaq tribe of Eastern Canada. Each portrays the agency including the moral agency of the natural world. This radically undermines anthropocentrism. Erhard is in comparative religious ethics at Saint Mary's University in Halifax, Nova Scotia.

Erwin, Douglas H., *Extinction: How Life on Earth Nearly Ended 250 Million Years Ago*. Princeton, NJ: Princeton University Press, 2005. At the end of the Permian Period, 251 million years ago, about 90% of marine species perished in the deadliest mass extinction of all time. Terrestrial ecosystems suffered as well. The extinctions took place over a couple hundred thousand years. What was the cause? Nobody knows. "None of the extinction models fits all the evidence and some hypotheses require data that despite every effort have not been found." This sharply contrasts with the less severe end of Cretaceous extinction, where an extraterrestrial impact is widely accepted as the cause.)

Erwin, Edward, Sidney Gendin, and Lowell Kleiman, eds. Ethical Issues in Scientific Research. Hamden, CT: Garland Publishing Co., 1994. 430 pages. \$18.95, paper. \$60, cloth. Five articles on the ethics of animal research, including Peter Singer, Dale Jamieson, and Tom Regan. (v6,#1)

Erwin, T. L., "An Evolutionary Basis for Conservation Strategies," Science, August 16, 1991, Conservation strategies have been too anthropocentric--saving those species that are useful or interesting to humans. A more objective, nonanthropocentric conservation strategy would be to locate and save the evolutionary dynamic lineages, those ecosystem regions and species groups in which evolution and speciation is still actively taking place. Many of the species saved under current strategies are living fossils, dead-ends in the evolutionary process. (v2,#3)

Escobar, Arturo, "Constructing Nature: Elements for a Poststructural Political Ecology." Pages 46-68 in Peet, Richard, and Watts, Michael, eds. Liberation Ecologies: Environment, Development, Social Movements. London: Routledge, 1996. The discourse of "biodiversity" is a modern, recently invented discourse, and is used by Westerners to bring aboriginal peoples into the arena of modernism. Nature becomes "biodiversity reserves," local communities may lay claim to be the "owners" of their biodiversity; they learn to treat it as "natural capital" and their local knowledge as "intellectual property"--things of worth in global markets. All this bypasses the ways in which plants and animals once figured in the aboriginal cultures (p. 57). Escobar is in anthropology, University of California, Berkeley. (v.13,#1)

Eser, Uta. "Assessment of Plant Invasions: Theoretical and Philosophical Fundamentals." Pages 95-107 in U. Starfinger, K. Edwards, I. Kowarik and M. Williamson, eds., Ecological Mechanisms and Human

Responses (Leiden, The Netherlands, Backhuys Publishers, 1998). There is a tendency among ecologists to regard biological invasions as obviously negative. To question value-judgments based on "ecological evidence," I present an analysis of the impact of non-scientific values and norms on the scientific writing about introduced plants. Special concern is given to the suspicion of a xenophobic bias. Scientific terms like "alien" or "invasion" bear negative connotations that might influence perception and evaluation. Furthermore, the terminology often reflects a conservation bias. Like the term "weed" the terms "invasive" or "neophyte" denote interference with conservation or management goals. The concept of the plant community also influences assessments. In an organism-like community, intruders necessarily are seen as afflicting the health or integrity of the whole. The concept of disturbance or the hypothesis of natural stability refer to an ideal of nature as a harmonic cosmos. From this perspective, human interventions necessarily are conceived as destructive. Conservationists tend to idealize pristine nature as intrinsically good, harmonic and stable. The opposite image of nature "red in teeth and claws" suggests that nature must be controlled and subjected by humans. As spreading introduced plants are neither nor controllable, they are conceived as negative from the perspective of conservation. I claim that the replacement of original vegetation by a new species may not per se be assessed negatively, but needs further reasons. The conservation of biodiversity or endangered species is a reasonable argument, the preference for natives is not. Eser is at the University of Tübingen, Center for Ethics in Science. She recently completed a Ph.D. dissertation on exotic species. (v.11,#3)

Eser, Uta. "Ecological and Normative Fundamentals of Value Judgments in Nature Conservation: The Case of Nonindigenous Plants," Advances in Human Ecology 7 (JAI Press, 1998):293-312. There is a tendency among environmentalists to mistake the role of ecology. To question value judgments based on ecology, I present an analysis of values involved in the assessment of introduced plants. Special concern is given to the relation of ecology and values. I show that the common use of the terms "neophyte" or "invader" reveals a conservation bias. I describe how organismic concepts of the community, the concept of disturbance, or the hypothesis of natural stability, refer to an idealized nature as an harmonic cosmos. Conservationists also tend to idealize pristine nature as intrinsically good, harmonic and stable. They neglect the opposite image of a "wild" nature, that must be controlled and subjected by humans. Eser is at the University of Tübingen, Center for Ethics in Science. (v.11,#3)

Estabrook, Barry, "Some Sport," Audubon 107(no. 6, Sept./Oct. 2005):11-12. Internet hunting. Dale Hagberg, a quadriplegic in bed in Indiana, aimed a remote-controlled high-powered rifle at a fallow deer in Texas, and missed. Next day he shot and killed a mouflon sheep. The owner of Live Shot thought it a great success, but the Texas Parks and Wildlife Department hurriedly enacted regulations to prohibit hunting wild game this way. Later the state legislature also prohibited such hunting on game farms.

Estes, Carol, "Trading Park Futures," National Parks, September/October 1996. Reprinted in PERC Reports 14, no. 4, December 1996, with replies by PERC spokesman. A thoughtful critique of free market environmentalism, as advocated by PERC, the Political Economy Research Center, a conservation think tank that works out the economic theory behind the property rights movement and free market environmentalism. Essentially, free market environmentalism holds that markets are, in almost all cases, the best avenue through which to protect natural resources. Estes has many doubts, essentially that the profit motive is not sufficient to protect many environmental goods, which are commons. The whole exchange, as found in PERC Reports, is suitable for use in a single class discussion on this topic. But people who read PERC ought also read Freyfogle, Eric T., "Ethics, Community, and Private Land," Ecology Law Quarterly 23(1996):631-661; see that entry. Copies of the Estes article from PERC, 502 S. 19th Avenue, Suite 211, Bozeman, MT 59715. Phone 406/587-9591. Fax 406/586-7555. Estes is a free

lance journalist who lives in Minnesota.

Estés, Clarissa Pinkola, Women Who Run With the Wolves: Myths and Stories of the Wild Woman Archetype. New York: Ballentine Books, 1992. 521 pages. \$ 20.00 "Within every woman there is a wild and natural creature, a powerful force, filled with good instincts, passionate creativity, and ageless knowing. Her name is Wild Woman, but she is an endangered species. Though the gifts of wildish nature come to us at birth, society's attempt to "civilize" us into rigid roles has plundered this treasure, and muffled the deep, life-giving messages of our own souls. Without Wild Woman, we become overdomesticated, fearful, uncreative, trapped." Estés is a Jungian analyst who lives in Colorado and Wyoming. Her book has been number one on the New York Times non-fiction best-seller list. (v4,#1)

Esty, Daniel C., "Toward Optimal Environmental Governance," New York University Law Review 74(December 1999):1495-1574. Better environmental results depend less on fine tuning theories of environmental federalism than on improving regulatory performance. Simply put, how we regulate is more important than where we regulate. Current environmental policy efforts fall short for a number of reasons: technical information shortcomings, "structural" or jurisdictional mismatches, and public choice distortions. A theory of optimal environmental governance must seek to address each of these sources of regulatory failure. A long article. Esty is Associate Dean, Yale School of Forestry and Environmental Studies, also in Law, Yale Law School. He was earlier Deputy Chief of Staff for Policy, U.S. Environmental Protection Agency.

European Environmental Yearbook 1991. From the DocTer Institute for Environmental Studies. Covelo, CA: Island Press, 1991. 1,100 pages. \$ 165.00. A comprehensive guide to the environmental policies, laws, and regulations of the European Economic Community. Air and water pollution, nuclear safety, toxic and hazardous wastes, land reclamation. (v2,#3)

Evanoff, Richard J., "Reconciling Realism and Constructivism in Environmental Ethics," Environmental Values 14(2005):61-81. This paper outlines a constructivist approach to environmental ethics which attempts to reconcile realism in the ontological sense, i.e., the view that there is an objective material world existing outside of human consciousness, with the view that how nature is understood and acted in are epistemologically and morally constructed. It is argued that while knowledge and ethics are indeed culturally variable, social constructions of nature are nonetheless constrained by how things actually stand in the world. The 'realist' version of constructivism proposed here can be linked to dialectical forms of reasoning which see knowledge and ethics as arising out of human interactions with an objectively real environment, and contrasted with strong constructivist views which see nature as 'nothing more than' a social construct. While both the physical environment and human attitudes towards it are in part socially constructed, nature also retains a measure of autonomy, or 'wildness', apart from human constructions. Evanoff is in the School of International Politics and Economics, Aoyama Gakuin University, Tokyo, Japan. (EV)

Evanoff, Richard, "A Constructivist Approach to Intercultural Dialogue on Environmental Ethics" Ph.D. thesis, Institute for Environment, Philosophy, and Public Policy at Lancaster University, U.K. Current trends towards globalization are creating entirely new social and environmental problems which require the development of a new global ethic. How cross-cultural dialogue on a global ethic can be effectively conducted among cultures with differing epistemological, value, and ethical orientations. An adequate framework for intercultural dialogue is provided by neither foundationalist nor relativist theories of ethics and an alternative constructivist theory which acknowledges the historically contingent and socially situated nature of cultural discourses but contends that the current global situation creates an entirely new *situs* in which intercultural dialogue on environmental ethics becomes not only possible but also necessary. A global ethic which adopts human flourishing, social justice, and environmental integrity as its guiding objectives. Since current forms of development are unable to meet these objectives, an alternative bioregional paradigm is developed which calls for the creation of economically self-sufficient and politically decentralized communities delinked from the global market but confederated at appropriate levels to address problems that transcend cultural borders. Alan Holland and John O'Neill were advisors; Vernon Pratt was the internal examiner; Philip Sarre of the Open University was the external examiner. Evanoff is a professor in the School of International Politics and Economics at Aoyama Gakuin University in Tokyo, Japan and can be contacted at <evanoff@sipeb.aoyama.ac.jp>. (v.13,#2)

Schweitzer's respect for life. Paul Taylor's biocentrism. Biocentric anthropocentrism. Toward a philosophy of the hunt. The ethics of catch and release fishing. A distinctive niche of this book is working out an environmental ethic, respect for nature, enlarged from an ethic of hunting and fishing. Evans is in philosophy and environmental studies, Washington University, St. Louis.

Evans, Jason M., Ann C. Wilkie and Jeffrey Burkhardt, "Adaptive Management of Nonnative Species: Moving Beyond the "Either-Or" Through Experimental Pluralism," *Journal of Agricultural and Environmental Ethics* 21(2008):521-539. This paper develops the outlines of a pragmatic, adaptive management-based approach toward the control of invasive nonnative species (INS) through a case study of Kings Bay/Crystal River, a large artesian springs ecosystem that is one of Florida's most important habitats for endangered West Indian manatees (*Trichechus manatus*). Building upon recent critiques of invasion biology, principles of adaptive management, and our own interview and participant-observer research, we argue that this case study represents an example in which rigid application of invasion biology's a-priori imperative to minimize INS has produced counterproductive results from both an ecological and social standpoint. As such, we recommend that INS control in Kings Bay should be relaxed in conjunction with an overall program of adaptive ecosystem management that includes meaningful participation and input from non-institutional stakeholders. However, we also note that adaptive management and INS control are by no means mutually exclusive, in Kings Bay or elsewhere. Instead, we suggest that adaptive management offers a means by which INS control efforts can emerge from—and be evaluated through—ongoing scientific research and participatory dialogue about the condition of specific places, rather than non-contextual assumptions about the harmfulness of INS as a general class. The authors are in several departments at the University of Florida, Gainesville.

Modern varieties of traditional crops, especially rice, have dramatically increased production in some areas, but unevenly across crops and regions. Consumers have generally benefited, but farmers benefit only if their costs saved are greater than the lower prices they now receive for the additional food. Prospects for a continued green revolution are quite mixed. The authors are in economics, Yale University. (v 14, #3)

Everett, Jennifer, "Environmental Ethics, Animal Welfarism, and the Problem of Predation: A Bambi Lover's Respect for Nature," Ethics and the Environment 6(no. 1, 2001):42-67. Many environmentalists criticize as unecological the emphasis that animal liberationists and animal rights theorists place on preventing animal suffering. The strong form of their objection holds that both theories absurdly entail a duty to intervene in wild predation. The weak form holds that animal welfarists must at least regard predation as bad, and that this stance reflects an arrogance toward nature that true environmentalists should reject. This paper disputes both versions of the predation critique. Animal welfarists are not committed to protecting the rabbit from the fox, nor do their principles implicitly deprecate nature. Everett is in philosophy, University of Anchorage, Alaska. (E&E)

Everett, Michael D. and Robert Peplies, "The Political Economy of Environmental Movements: U.S. Experience and Global Movements." Environmental Values Vol.1 No.4(1992):297-310. ABSTRACT: In 1972 a public choice model predicted that the incipient environmental movement in the United States would grow but encounter overwhelming industrial opposition. Twenty years later we find the model overstated this opposition. Environmental pressure groups were able to pass substantial legislation, resist counter forces, and reduce most targeted pollutants. A revised public choice model predicts that the success of the present global environmental movement depends on (1) information flows between scientists and the public on the potential costs of deterioration, and (2) means for reducing the costs of regulation such as relying more on market incentives. KEYWORDS: Environment (political aspects), environmental movements, environmental policy, environmental protection, politics (environmental aspects), public choice models. Evernden, Neil, The Natural Alien: Humankind and Environment. Toronto: University of Toronto Press, 1985. Second edition, 1993. Homo sapiens is the one species on Earth that is "naturally alien," by which Evernden means that human nature is genetically disposed to break away from our evolutionary history and to form cultures built by technology. So we repeatedly and naturally "alienate" ourselves from wild nature. We are natural aliens because we are essentially technological beings, living by "the encountering of the world as a field for the use of tools" (p. 67). Ecologically, humans are "exotics" (p. 109). We have no niche; we rebuild nature. Born with this "congenital deformity" (p. 137) which

emerged with our species, we are unable to encounter the world as anything other than our resource, unable to relate to anything in nature as having intrinsic value. So "there is no possibility of an environmental ethic ... in a society dominated by the technological vision of the world" (p. 69). Evernden hopes this is not "an entirely pessimistic conclusion" (p. 123) because humans, despite this congenital deformity also have an unfinished "essential openness" (p. 122), and maybe we can break away from this innate tendency to be natural aliens and find more harmony with nature.

Ewbank, Roger, "Farm Animal Welfare: A Historical Overview", Journal of Agricultural and Environmental Ethics 6(1993). One result of Ruth Harrison's 1964 book *Animal Machines* was the UK Brambell Committee report on the welfare of animals kept under intensive livestock husbandry systems. The Council of Europe took on, from the Brambell Committee evidence, the idea that animals have ethological needs. The concept of rights is somewhat foreign to the UK, but the government's Farm Animal Welfare Council has suggested that farm stock should be kept so that they enjoy the so-called New Five Freedoms - including freedom from suppression of "normal" behaviour. Currently two conflicting forces act in the animal welfare area: the seemingly high need of consumers for cheap high-quality animal protein foods and the demand, by the animal rightists, that humans should not use animals at all. Ewbank is with the Universities Federation for Animal Welfare, 8 Hamilton Close, South Mimms, Potters Bar, Herts EN6 3QD, United Kingdom.

Ewing, Rodney C., and Macfarlane, Allison, "Yucca Mountain," Science 296(26 April 2002):659-660. U.S. President Bush has recommended Yucca Mountain in Nevada as the U.S. site for the disposal of 400 metric tons of high-level nuclear waste, mainly the used fuel from commercial nuclear power plants. The Secretary of Energy claims "sound science," but these scientists have many doubts. "In our view, the disposal of high-level nuclear waste at Yucca Mountain is based on an unsound engineering strategy and poor use of present understanding of the properties of spent nuclear fuel." A main problem is that there isn't any serious alternative, and politics is driving the need for a storage facility, which is resulting in twisting the estimates of probabilities. A bigger problem is that estimates have to be made across many disciplines from atomic physics to geology, to materials science (reliability of containers, barriers), to likelihood of systems failure, across tens of thousands of years, with serious and involuntary risks. Nothing like this has ever been done before. Ewing is in nuclear engineering at the University of Michigan, Ann Arbor. Macfarlane is in security studies at MIT, Cambridge, MA. (v.13,#2)

Fabel, Arthur J., "Environmental Ethics and the Question of Cosmic Purpose." Environmental Ethics 16(1994):303-314. In the context of the earlier views of John Haught, I discuss the paradox that while environmental philosophers seek a viable ethics, advocates of the majority view, scientific materialism, deny an intrinsic value to nature. I argue that a new science, just now arising, may set aside this pessimistic view, replacing it with a conception of the cosmos as a self-organizing genesis. Its method is holistic and integrative rather than analytical and divisive. After a survey of its overall outlines, I introduce some salient features of the central trend, a key property, and a universal complementarity and explore their relevance for a scientifically based natural ethics that takes into account an ecological self, animal awareness, and cooperative communities. Fabel is at 620 Bay Road, Amherst, MA. (EE)

Faber, Daniel. *Capitalizing on Environmental Justice: The Polluter-Industrial Complex in the Age of Globalization*. Lanham, MD: Rowman & Littlefield, 2008. Some of the major challenges facing today's environmental justice movement (EJM) are the global exportation of ecological hazards, capital restructuring, and the weakening of consumer, environmental, and occupational laws, all of which disproportionately hit poor people of color and the working class the hardest. Faber analyzes these challenges and shows how the EJM resists the polluter-industrial complex to bring about meaningful social transformation.

Faber, Malte, Reiner Manstetten and John L. R. Proops, "Humankind and the Environment: An Anatomy of Surprise and Ignorance." Environmental Values Vol.1 No.3(1992):217-242. ABSTRACT: This paper addresses the problem of 'ignorance' in philosophy and science, particularly with respect to the

conceptualization, study and solution of environmental problems. We begin by distinguishing between 'risk', 'uncertainty' and 'ignorance.' We then offer a categorization of ignorance, and use these categories to assess the role of science as a means of reducing ignorance. We note that to proceed with science, several 'acts of faith' are necessary. We conclude with a discussion of the importance of an attitude of openness in science and philosophy, especially regarding environmental problems. Throughout, we illustrate our discussion of ignorance, and the problems involved in its reduction, by reference to environmental issues. KEYWORDS: Environment, ignorance, openness, surprise. Faber and Manstetten: Alfred Weber-Institut, Department of Economics, Universitat Heidelberg, Grabengasse, 6900 Heidelberg, Germany. "Preoccupation with parks, wilderness, and the preservation of wild spaces for recreation is destructive.... because it miseducates us and our children about the relationship between humans and the natural world, and because it focuses attention on the wrong lands and the wrong activities Environmentalists, in my experience, have expended far too much effort lobbying the federal government for the preservation of untrammelled wilderness ... in the pursuit of the utterly nutso (sic) belief that if we can simply bar humans from those areas, they will be preserved, preferably forever.... The preservation of the world, I would argue, is not in 'wildness', but in the working landscape. And defining that is more appropriately a regional, local and community undertaking than a role for the federal government....

The garden rather than the wilderness is the appropriate metaphor for the touchstone of land management. [But for environmentalists] The ideal landscape is not an agrarian setting as in Jefferson, where decent hardworking folk toil to make a living from the earth, but one which is totally removed from human use, except for the privileged to retreat for leisure and refreshment. No room is left in this vision for people to live and work in the natural world....The preoccupation with wilderness leaves no opportunity to learn about gentle use of the land.... " Fairfax is professor of forestry at UC-Berkeley, and the author of the second edition of Samuel Trask Dana's Forest and Range Policy: Its Development in the United States, 1956, 2nd ed., 1980, McGraw-Hill, a well-known text. (v6,#4)

Fairweather, P. G., "Links between Ecology and Ecophilosophy, Ethics and the Requirements of Environmental Management," Australian Journal of Ecology 18 (1993): 3-19. A two-way interaction between ecology and ethics will continue to bear fruit for both disciplines. We need to address fundamental issues of definition and meaning before useful debate can occur in environmental decision-making. Legal requirements of environmental legislation should be met, but we should act more in line with the spirit of the legislation. Science is not paramount in decision-making; psycho-social factors are. Philosophy and ethics offer a wide range of perspectives that can benefit ecology, though, in general, philosophers have listened to ecologists better than ecologists have listened to philosophers. Ecology needs to guide ecophilosophers as to how nature works, why we expect variability in ecosystems, what is natural, and other issues where a scientific understanding of nature has progressed further than many are aware. Fairweather is in the Graduate School of the Environment, Macquarie University, NSW, Australia. (v5,#4)

Farber, S, et al., "Linking Ecology and Economics for Ecosystem Management," BioScience 56 (no. 2, February 2006): 121-133. Outlines an approach, based on ecosystem services, for assessing trade offs inherent in managing humans embedded in ecological systems. Evaluating these trade offs requires an understanding of the biophysical magnitudes of the changes in ecosystem services resulting from human actions, and of the impact of these changes on human welfare. We summarize the state of the art of ecosystem services based management and the information needs for applying it. Three case studies of Long Term Ecological Research (LTER) sites coastal, urban, and agricultural illustrate the usefulness, information needs, quantification possibilities, and methods for this approach.

Farnsworth, Elizabeth J. and Judy Rosovsky, "The Ethics of Ecological Field Experimentation," Conservation Biology 7(1993):463-472. Ecological research, though it generates information supporting conservation efforts, raises ethical issues when we propose to modify or endanger the individual organism, population, species, or ecosystem. Yet the scientific literature contains little explicit consideration of such study. This is due to (1) trepidation about controversy that could endanger research efforts, (2) assumptions that the benefits outweigh the cost, (3) difficulties in perceiving the negative impacts of such study, and (4) tacit assumptions about certain experiments that are simply "wrong" to do.

Such ethical issues are increasingly arising. The literature on environmental ethics and experimentation affords diverse and occasionally conflicting value systems on which to build an ethical of ecological experimentation. Ethical considerations are compatible with sound scientific protocols. The authors encourage a dialogue between scientists and philosophers. Both authors are in biology at the University of Vermont. Farrelly, Elizabeth. *Blubberland: The Dangers of Happiness*. Cambridge, MA: The MIT Press, 2008. Farrelly critiques "Blubberland" a world of cosmetic surgery, gated communities, home entertainment systems, pension funds, posh resorts, quadruple-garaged mansions, stretch limos, SUVs, trophy homes, and vast malls and a state of mind in which we expect to be happy but in reality are increasingly bloated, bored, and miserable. She argues that our "superfluous superfluity" and goal of happiness lead to destructive habits and huge ecological footprints that jeopardize our survival.

Feagan, Robert and Ripmeester, Michael, "Reading private green space: competing geographic identities at the level of the lawn," Philosophy and Geography 4 (No. 1, 2001): 79-95. This paper focuses on private residential green space as a site of contested meanings. Recent research points to the emergence of an activism centered on ecological restoration and a shift away from the lawn as the only accepted landscape practice for private green space. However, it is clear that the lawn, a particularly powerful cultural landscape form in residential neighborhoods, still largely dominates this space across North America. This investigation examines the voices of two groups: traditional lawn owners and ecological activists. We observe two sets of discourses centered on private green space. Both groups construct residential green space as a site of identity politics -- a site wherein the self is defined as pure and the other excluded as different and necessarily inferior. And both perceive their discourse as 'natural'. The critical finding is that they are almost entirely oppositional discourses. The contest over what constitutes appropriate landscaping practices for this space provides a locus for bringing to a discursive level, the kinds of socio-cultural perspectives and practices that create and dominate our places in late capitalist society. We suggest that at present the lawn remains a barrier to alternative green space practices. Feagan is Assistant Professor of Geography at the University of Guelph. Ripmeester is Associate Professor of Geography at Brock University. (P&G)

The topic is climate change and tropical forests. One prediction has been that more CO₂ in the atmosphere might act as fertilizer, speeding up photosynthesis, causing trees to grow faster and larger, sequestering more CO₂ in woody tree tissues. To that extent, the problem might be self-fixing: more human-introduced CO₂ leads to more sequestering in tree body mass. But in an extensive study of data from tropical forests just the opposite was found; growth rates have been declining. Scientists are unsure why the counterintuitive result. Some speculation is that local increases in rainfall lead to less sunlight for photosynthesis. In any case, contrary to the problem being self-fixing, it seems to be self-aggravating. This article is also summarized in "The Impact of Climate Change on Tropical Forests" by Robert E. Cook, Public Garden Vol. 22, no. 2 (2007): 10-11.

Fenner, David E. W., "Environmental Aesthetics and the Dynamic Object," Ethics and the Environment 11(2006):1-19. I lay out a case for why those objects of aesthetic attention which are principally characterized as natural objects should be understood not statically, as existing in merely a three-dimensional fixed state, but as dynamic, as existing in a space-time context, complete with change, movement, and flux. After this, I explain why this is important, how the dynamic nature of natural objects raises a concern for aesthetically evaluating natural objects, and how that concern may be addressed. Fenner is in philosophy, University of North Florida. (Eth&Env)

Fenner, David E.W., "Aesthetic Appreciation in the Artworld and in the Natural World," Environmental Values 12(2003): 3-28. I explore some parallels and dissimilarities between aesthetic appreciation that takes as its focus art objects and that which focuses on natural objects. I cover three areas. The first deals with general approach, whether a paradigm of engagement is more appropriate to environmental aesthetics than one of detachment and disinterest. The second theme is about preservation and whether the appropriate model is static or dynamic. The final theme is about environmental criticism and the application of aesthetic theory to arguments for preservation. (EV)

Fenton, Elizabeth, Wild Animal Welfare and Common Sense Ethics, M. A. thesis, Colorado State

University, Spring 2002. Environmental ethics includes an ethics of respect for wild animals. There are two dimensions here, one is respect for the integrity of animal life, which includes caring for animals welfare; the other is respect for wildness. In much environmental ethics, for example in that of Holmes Rolston, valuing the wildness takes precedence over concern for animal suffering. This is similarly true when exotic (feral) animals are removed by killing in order to protect endangered species of plants, or ecosystems, also argued by William Throop. But a common sense ethic moves us to care about animal suffering; and such an ethic is, on reflection, well founded. The desire to extend humane treatment to wild animals expresses human moral compassion, and recognizes the fact that the capacity to suffer is a morally relevant characteristic shared by all sentient beings, regardless of whether they are wild. On occasions when we do encounter wild animals in distress, the moral and compassionate action is to reduce their suffering, not to let wild nature take its course. Fenton is from New Zealand. Livestock have routinely been given small doses of antibiotics to make farm animals grow slightly faster on less feed (the biology of which is not too clear, but it works). But there are worries about increasingly resistant bacterial disease microbes, about the transfer of the antibiotic residues to human consumers, and about the use of such antibiotics when needed to treat human diseases against now more resistant microbes. Denmark has phased out the practice and a World Health Organization study of the results have led to the recommendation that farmers worldwide kick the antibiotic habit. The European Union plans a phase out by 2006, but the U.S. is mostly continuing to use the antibiotic. (v 14, #3)

Fern, Richard L., Nature, God and Humanity: Envisioning an Ethics of Nature. Cambridge: Cambridge University Press, 2002. Why non-human animals and nature in general are proper objects of moral concern, and how human well-being depends on harmony with nature-as-created. Fern frames a philosophical ethics of nature, in dialogue with the principal figures in the field, assesses this ethics scientifically, finds support for it in traditional theism, and then situates it culturally. There is tension between a widespread respect for what science tells us about nature, simultaneously with a genuine conviction that there is more to nature than science reveals.

The analyses of philosophers in environmental ethics are important and insightful here. Discovering value in nature, which ought to be morally considered, is plausible and consistent with classical monotheism. In fact, the roots of the contemporary redirecting of ethics toward nature have deeper roots in the Biblical sources of Western values than is usually recognized. The insights of

monotheism are important and needed to formulate positive visions of the future, visions of a just and good world, of humans in harmony with nature. Fern defends both human uniqueness and the radical otherness of God; these make possible (rather than preventing) an appropriate relation to the wild creatures with whom we share the planet and to the supporting biosphere. Fern call this a "humane holism" (p. 7, p. 65ff). "My hope is to have cleared the way for a more fully developed theistic ethic of nature" (p. 215). This book grows out of a course in environmental ethics taught for over a decade at Yale University Divinity School, from which Fern is now retired. It rivals Michael Northcott's The Environment and Christian Ethics (Cambridge, 1996) as the most philosophically sophisticated work on a theistically-oriented environmental ethics. The world must be envisioned organically or be destroyed by stunted and sterile approaches. Ferré is Research Professor of Philosophy at the University of Georgia, and instrumental in the environmental studies faculty there. (v4,#2)

Ferré, Frederick, "Finding the Balance: A Response to Potter and Zucker," Ethics and the Environment 1(no.2, 1996):191-199. (E&E)

Ferré, Frederick, "Persons in Nature: Toward an Applicable and Unified Environmental Ethics," Ethics and the Environment 1(no.1, 1996):15-25. There is a dilemma facing mainstream environmental ethicists. One of our leading spokesmen, Holmes Rolston, III, offers a rich ethical position, but one that lacks internal connections between principles relevant to the environment and principles relevant to human society. These principles are just different; thus no higher-order guidance is available to cope with cases of conflict between them. A second major spokesman, Baird Callicott, recommends a "land ethics" that is internally coherent but sadly inadequate for addressing many distinctly human ethical concerns. To escape this dilemma I advocate an alternative worldview, "Personalistic Organicism." On this view, inspired by Alfred North Whitehead, a continuum of values, pervading the universe, can undergird a unified ethics in which human persons are recognized as especially valuable without rupturing the

continuities that bind humanity to the rest of the living (and nonliving) environment. Ferré teaches philosophy at the University of Georgia. (E&E)

Ferré, Frederick, Being and Value: Toward a Constructive Postmodern Metaphysics. Albany, NY: State University of New York Press, 1996. 424 pages. \$ 24.95 paper. Metaphysics with courage and conviction, persuasive and comprehensive, at a time when many are cultured despisers of it. Premodern philosophy intimately bound being and value. Modern philosophy divorced being and value. Postmodern philosophy is in transition from the modern mechanical worldview to an alternative inspired by ecology. The beauty of nature, along with other values, is a more potent ingredient in the structure of things than modern reductionism allows. One chapter is entitled: Toward an Ecological World Model. Another is: Toward a Kalogenic (Beauty-generating) Universe. Two more volumes: Knowing and Value, and Living and Value, are projected. Ferré is professor of philosophy at the University of Georgia. (v7,#1)

Ferré, Frederick, "Persons in Nature: Toward an Applicable and Unified Environmental Ethics," Zygon 28(1993):441-453. Two major contenders for the role of robust environmental ethics claim our allegiance. One is Baird Callicott's, based on the land ethical formulated by Aldo Leopold; the other is that of Holmes Rolston, III, sharply distinguishing environmental from social (human) ethics. Despite their many strengths, neither gives us the vision we need. Callicott's ethic leaves too much out of his picture; Rolston's leaves too much disconnected between nature and humankind. A really usable environmental ethic needs to be both comprehensive and integrated. For that, we need a world view that includes the human in nature but also affirms the unique values of personhood. Ferré is Research Professor of Philosophy at the University of Georgia. (v4,#4)

Ferré, Frederick, "Theodicy and the Status of Animals." American Philosophical Quarterly 23 (1986): 23-34. The starting point of this argument is the "Free-Will Defense" of God's goodness, given the existence of suffering in the world. Ferré finds this defense inadequate, because it permits the suffering of animals: since they lack freedom and moral responsibility, their suffering cannot be accounted for in God's plan. Ferré thus argues for an expanded sense of community between God, humanity, and the animal kingdom. (Katz, Bibl # 1)

Ferré, Frederick. "Value, Time, and Nature." Environmental Ethics 17(1995):417-431. Notoriously, beauty is subject to time's "tooth"; but--somehow--we sense also the imperviousness of achieved value to mere duration. This paradox is illustrated using a recent art event, and three principles analyzed from the case in point: (1) the exclusive intrinsic importance of subjective immediacy, (2) the necessity of intersubjective connections, and (3) the crucial place of instrumental value. Moving from art to metaphysics to nature, I conclude with discussions of habitat and of evolution. Only if a habitat's instrumental value (for many centers of subjective immediacy besides human ones) is adequately respected can anthropocentric values be prevented from always "trumping" all others. I reconsider evolution in terms of many interconnected value-realizing subjects, presenting the proffered "Kalogenic" perspective as a manifestation of the most fundamental process of the universe—one in which the pursuit, actualization, and defense of concrete beauty actually generates what we abstractly call "time." Ferré is in

the philosophy department, University of Georgia. (EE)

Ferré, Frederick. Being and Value: Toward a Constructive Postmodern Metaphysics. Albany, NY: State University of New York Press, 1996. Works Cited; Name Index; Subject Index. 406 pp. \$24.95 paper. Ferré is Research Professor of Philosophy at the University of Georgia and a pioneering scholar in environmental philosophy. He has published several books and numerous articles. Ferré was for many years the editor of the journal Research in Philosophy and Technology, and he was co-founder of the Faculty in Environmental Ethics at the University of Georgia.

Being and Value is Volume One of a trilogy with the overall title Philosophy and Value. Volume Two is currently in press and is entitled Knowing and Value: Toward Constructive Postmodern Epistemology. It should be available in early 1998. Volume Three is currently being written and is titled Living and Value: Toward Postmodern Ethics, Religion, and Social Ecology. All three volumes will be published SUNY Press in the series "Constructive Postmodern Thought," edited by David Ray Griffin, a process theologian and philosopher at Claremont Graduate School (California).

Ferré's trilogy is arguably the first sustained attempt to create a truly comprehensive environmental philosophy--epistemology, metaphysics, ethics, aesthetics, philosophy of religion, and all. Ferré's main philosophical mentor in the project is Alfred North Whitehead. Although many philosophers and environmentalists have agreed that Whitehead's process philosophy is conducive to a strong, constructive environmental ethic (and environmental philosophy generally), Ferré in these volumes is the first philosopher to develop the process position in its ecological fullness. The project is no easy task, and philosophers and environmentalists alike owe a debt of gratitude to Ferré. Guided by the concept of ecological relatedness, Ferré develops what he calls an "ecological worldview." His metaphysic and epistemology have been shaped almost as much by the environmental scientists Eugene Odum and Frank Golley as by Whitehead. The trilogy draws out the implications of an environmental (ecological) philosophical worldview. Starting with the ancient Greek sense of kosmos (a value-laden concept) and working through the modern metaphysical problematic (the loss of mind, purpose, and value in nature), Volume One offers an ecological answer to the problematic. Then, Volume Two works through the modern epistemological problematic (the epistemological gap caused by the alienation of mind from nature), and, again, offers an ecological answer. Finally, Volume Three will be a direct examination of value--of ethics, religion, environment, and what Ferré calls "social ecology." Volume Three will include analyses of the kinds of technology and other institutions needed for an ecologically benign (postmodern) world.

Parts One and Two of Being and Value (Volume One of the trilogy) are re-examinations of classical Greek philosophy ("Premodern Metaphysics") and modern philosophy ("Modern Metaphysics") in light of contemporary postmodern ecological consciousness. (What is missing in the volume is the Medieval era, which Ferré may be saving for Volume Three since the Medieval era was dominated by philosophy of religion. Although the Medieval era has been widely rejected by Enlightened Modern and contemporary analytic and continental philosophers, the postmodern viewpoint may allow the era to be seen anew without these biases.) Part Three ("Postmodern Metaphysics") will be of special interest to environmentalists and philosophers alike. It is here that Ferré is at his best in constructing a postmodern, Whiteheadian ecological view of reality. Reality is deeply, pervasively ecological: namely, it is interconnected, organic, personalistic, and kalogenic (Ferré's term for the universe's tendency to generate value). The deepest and highest intrinsic value, Ferré argues, is experiential--the relatedness of actual entities to one another. Reality is "panexperiential," that is, personalistic and intersubjective all the way down, and all the way up. Value is not fabricated inside subjective minds that are evolutes from inert matter; rather, all of reality--the very fabric of being itself--is by its very nature laden with values. The volume is courageously comprehensive and epistemically persuasive, at a time when few philosophers or environmentalists have the knowledge or critical ability to construct such a position. (v8,#1)

Ferré, Frederick. "Obstacles on the Path to Organismic Ethics: Some Second Thoughts." Environmental Ethics 11(1989):231-241. An organismic viewpoint is a welcome alternative to modern mechanistic

consciousness, with the latter's excessive epistemic reliance on analysis, its ontological presumption of atomism, and its value commitments to competition, quantification, reduction, and predictability. These ideas have had negative social and environmental consequences and require replacement. Organismic ethics, grounded in the "wisdom of life"--especially the dialectical triad of creativity, homeostasis, and holism--is far healthier. But organicism alone has serious defects sometimes overlooked by environmental enthusiasts (earlier including this author): life's creativity wastes individual organisms, and life's holism neglects the unique value of parts in favor of larger unities. Is it possible to work out a genuinely personalistic organicism? Traditional personalistic idealism will not do, but insights into essential personal qualities may enrich the concepts of creativity, homeostasis, and holism enough to offer a start toward a more adequate ethic. Ferré is in the department of philosophy, University of Georgia, Athens, GA. (EE)

Field, Terri. "Caring Relationships with Natural and Artificial Environments." Environmental Ethics 17(1995):307-320. A relational-self theory claims that one's self is constituted by one's relationships. The type of ethics that is said to arise from this concept of self is often called an ethics of care, whereby the focus of ethical deliberation is on preserving and nurturing those relationships. Some environmental philosophers advocating a relational-self theory tend to assume that the particular relationships that constitute the self will prioritize the natural world. I question this assumption by introducing the problem of artifact relationships. It is unclear whether a relational self theory recognizes relationships with the artificial world as being meaningful in any moral sense, and whether such relationships, if they can exist, should be accorded equal value to relationships with the natural world. The problem of artifact relationships becomes particularly apparent when the relational-self theory is linked to place-based ethics. If our ethics are to develop from our relations to place, and our place is largely an artificial world, is there not a danger that our ethical deliberations will tend to neglect the natural world? I adapt Holmes Rolston's concept of "storied residence" to show how the inclusion of the artificial world will lead to different questions regarding one's resident environment, and perhaps a different emphasis on what is valued. My aim in raising these questions is to challenge the optimism that writers such as Karen Warren and Jim Cheney have shown in supporting relational-self theories and place-based ethics. I conclude that the challenge to develop a relational-self/place-based ethic does not appear to have been met within Western environmental philosophy, which has perpetuated a silence on the matter of our embedment in the artificial world. Field is in the department of philosophy, University of Queensland, Australia. (EE)

Fieser, James, "An Argument against Normative Eco-Centrism." Pages 496-504, p. 516, p. 530, in Fieser, James ed., Metaethics, Normative Ethics, and Applied Ethics: Historical and Contemporary Readings. Belmont, CA:Wadsworth/Thomson Learning, 2000. Critiques Aldo Leopold, J. Baird Callicott, James Heffernan. Eco-centrism begins with a bold claim that traditional morality is not complete and that we need to acknowledge a new set of direct obligations to ecosystems. But eco-centrism fails as an act-consequentialist theory because we cannot derive traditional moral duties from a primary principle of eco-centrism. As a rule-consequentialist theory, eco-centrism fails because it is inconsistent with traditional moral rules, such as prohibitions against stealing. Although consequentialist eco-centrism does provide us with normative guidelines for preserving environmental well-being, it does not advocate traditional human morals, and therefore we must reject it as a normative theory. Fieser is in philosophy, University of Tennessee, Martin, TN. (v.11,#3)

Fieser, James. "Callicott and the Metaphysical Basis of Ecocentric Morality." Environmental Ethics 15(1993):171-80. According to the theory of ecocentric morality, the environment and its many ecosystems are entitled to a direct moral standing, and not simply a standing derivative from human interests. J. Baird Callicott has offered two possible metaphysical foundations for ecocentrism that attempt to show that inherent goodness can apply to environmental collections and not just to individual agents. I argue that Callicott's first theory fails because it relies on a problematic theory of moral sentiments and that his second theory fails because it rests on an unsupported parallel between the breakdown of the subject-object dichotomy suggested by quantum theory and an alleged actualization of morality upon the interaction of environmental collections with consciousness. Finally, I argue that Callicott overrates the need for a metaphysical grounding of inherent value, and that the metaphysical question has little bearing on the normative issue of ecocentrism. Fieser is in the department of philosophy, Christopher Newport University, Newport News, Virginia. (EE)

Figge, Frank, "Capital Substitutability and Weak Sustainability Revisited: The Conditions for Capital Substitution in the Presence of Risk," Environmental Values 14(2005): 185-201. The capital approach is frequently used to model sustainability. A development is deemed to be sustainable when capital is not reduced. There are different definitions of sustainability, based on whether or not they allow that different forms of capital may be substituted for each other. A development that allows for the substitution of different forms of capital is called weakly sustainable. This article shows that in a risky world and a risk-averse society even under the assumptions of weak sustainability the circumstances under which different forms of capital may be substituted are limited. This is due to the risk-reducing effect of diversification. Using Modern Portfolio Theory this article shows under which conditions substitution of

different forms of capital increases risk for future generations. Figge is in the School of Earth and Environment, University of Leeds, UK. (EV)

Figuerola, Robert Melchior, Debating the Paradigms of Justice: The Bivalence of Environmental Justice. Ph.D. dissertation in philosophy, University of Colorado, Boulder, 2000. Environmental justice addresses social justice related to human activities that affect both human and natural environments, including human health and values, living and working conditions, natural resources upon which humans depend, and cultural values intimately tied with the natural environment. The social problem may be the cause of the environmental problem or vice versa.

The thesis analyzes how environmental justice affects the debate between distributive justice and justice in the politics of recognition. Distributive justice theories focus on the fair distribution and redistribution of material goods in a society. Justice in the politics of recognition emerges from principles of self-determination, cultural identity, and political recognition. Cultural institutions and habits determine the conditions for social status which then guide the distribution of material goods. Contemporary justice theory seems gridlocked into this dichotomy. Using the work of Nancy Fraser, this thesis uses a bivalent conception of participatory parity as the bridging criterion. The main advisor was Claudia Mills. Figuerola is from Puerto Rico. Figuerola is currently at Colgate University. (v.11,#2)

Filson, Glen C. "Demographic and Farm Characteristic Differences in Ontario Farmers' Views about Sustainability Policies," Journal of Agricultural and Environmental Ethics 9(1996):165-180. This study was undertaken to assess farmers' attitudes toward sustainable agriculture and the environment. The majority of Ontario farmers in this 1991 survey supported the need for government policies which promote sustainable agriculture but there were major differences in the government policies which farmers thought would be sustainable or desirable. Most farmers felt the Government should promote diversified rural economic development, sponsor appropriate research and provide conservation grants to farmers willing to change to more sensitive environmental methods. Those least interested in forms of government intervention designed to enhance agricultural sustainability operated the largest farms.

Conversely, those most likely to be receptive to government regulations and interventions designed to enhance rural equity, stability, productivity and sustainability were the smaller operation farmers who most often had off-farm employment. Keywords: sustainability, government agricultural policies, environmental regulations, family farm support. Filson is with the Rural Extension Studies, University of Guelph, Ontario. (JAEE)

Filson, Glen C., "Comparative Differences in Ontario Farmers' Environmental Attitudes", Journal of Agricultural and Environmental Ethics 6(1993):165-184. This paper provides an analysis of a 1991 survey of the views of a stratified random sample of 1,105 Ontario farmers. Factor analysis, Kruskal-Wallis one way ANOVA, chi-square and correlations were used to identify differences in farmers' attitudes toward rural environmental issues as a function of their demographic and farm characteristics. Younger, well educated, and especially female, farmers were most concerned about the rural environmental degradation, in contrast to the largest operators' being the least environmentally oriented. Filson is in rural extension studies at the University of Guelph, Ontario.

Firth, Dan, "The Role of Aesthetic Considerations in a Narrative Based Approach to Nature Conservation," Ethics and the Environment 13(no. 2, 2008):77-100. The claim presented here is that aesthetic considerations are an essential part of place narrative, and are thus essential to ethical

environmental decision-making. Holland's narrative-based approach to nature conservation is taken as a starting point from which an argument is developed to show how his approach can be extended to include the aesthetic. Aesthetic experience of place is important because it gives us knowledge by acquaintance of the place, because it gives meaning to our relationship to the place, and because it reveals and gives insight to meaningful relationships within the place. The narrative approach allows these experiences and meanings, which are problematic to other approaches, to be captured and included in environmental decision-making. Dan Firth is studying in the Centre for Professional Ethics at the University of Central Lancashire.

Firth, Dan, "Do Meaningful Relationships with Nature Contribute to a Worthwhile Life?," *Environmental Values* 17(2008): 145-164. This paper argues that a worthwhile life is one in which the meaningful relationships existing in nature are recognised and respected. A meaningful relationship occurs when the interactions between two entities have significance in their past history and its anticipated continuation. The form in which the history of both the human and the non-human is related is narrative. A life is enriched or impoverished by the subject's relationships to other people and nature, and as such is more or less worthwhile. The argument presented here shows how Alan Holland's approach to conservation decision making can be extended to have relevance to individual lives, and that a strong ethical position can be developed from this insight.

Fischedick, Manfred, and Supersberger, Niko, "Erneuerbaren Energien gehört die Zukunft (The future belongs to renewable energies)" In German. *Natur und Kultur* 2(no. 1, 2001):76-96. Abstract: Rising temperatures, severe storms, eroded coast lines ? will this be our future? All the evidence seems to indicate that this will happen if we don't change our behaviour. Indeed we have an alternative to burning fossil fuels like coal, oil and natural gas, we don't have to accept the greenhouse effect as a natural event (which it really isn't). One possible way out of the imminent dilemma is increasing the use of renewable energies and an efficient use of energy. A practical solution how this can be achieved is presented. (v.12,#2)

Fischer, Kenneth S., Barton, John, Khush, Gurdev S., Leung, Hei, and Cantrell, Ronald, "Collaborations in Rice," *Science* 290(2000):279-280. Rice is the largest food source for the poor, the staple of Asia, and also provides employment and income for vast numbers of rural people. Genetic and genomic research in rice has formerly been mostly public, government sponsored research, but the trend is toward private, industry sponsored research. There is growing concern that the poor will not benefit from such research, since the results are often proprietary. These authors, from the International Rice Research Institute, Philippines, propose a model by which patents are available on research discoveries, but rights to these must be made available at reasonably royalty in commercial markets in the developing world, and at zero royalty for subsistence farming. (EE v.12,#1)

Fischer, Megan, "Should We Save Nature While People Go Hungry?: An Analysis of Nature Preservation and Poverty." M.A. thesis, Philosophy, Colorado State University. 2000. Sometimes, the most ethical decision is to preserve nature even if some people have basic needs unmet. This issue is important and often faced in nature preservation internationally. Some case studies. Priority should be given to win-win situations, where needy people can remain on lands without degrading them or harming wildlife. Attention needs to be given to the deeper social problems that underlie and cause such poverty. Also one must consider whether policies are likely to succeed or be counter-productive. Sustainable development, though desirable, is not always an answer. Analysis must take all values into account, including the holistic values, and optimizing such value will require saving nature even though human needs go unmet.

This ought to prove an interim ethic, and on longer time scales future generations of humans are likely to be better off in result. (v.11,#4)

Fish, Stanley, The Trouble with Principle. Cambridge, MA: Harvard University Press, 2000. Nobody's neutral. It is dangerous to believe you have principles and still more dangerous to speak and act as if you do. "Principles" are abstract, neutral, and general standards for judging and resolving particular substantive differences. Things like fairness, impartiality, and justice are supposed to be so neutral that they work for all parties to the debate. A radical ecofeminist and a conservative Southern Baptist ought to be able to agree on what is a fair way to divide the pie. Fish thinks this is liberal mythology. There are no neutral principles, no standards not already infected with substantive commitments about the way the world is. To pretend there is has been the error of liberalism for recent decades, and this foists a particular world view on others. (Liberals especially dupe religious people with their worldview.)

Politics (and ethical claims within it) is a struggle whose goal is victory, which means getting the kind of policies you want in place. This is the only kind of politics or law that there is. We should abandon the search for rationally demonstrable foundations that would show a particular action to be right. Our concern should be to find ways to put the policy, whatever it is, into place (and this can include some theoretical claims, if these succeed). In the end, there is nothing but rhetoric; rhetoric, like politics, goes all the way down. Environmentalists, pragmatists, postmodernists, take note. (v.11,#3)

Fisher, Andy, Radical Ecopsychology: Psychology in the Service of Life. Albany, NY: State University of New York Press, 2002. (v.13, #3)

Fisher, Andy, Nature and Experience: A Radical Approach to Ecopsychology, 1999, York University (Canada), Ph.D. thesis in Environmental Studies. 343 pages. I propose an approach to ecopsychology which is (1) naturalistic, in that it aims to link human nature to the larger natural world; (2) experiential, in that it uses bodily felt meaning as its touchstone; (3) and radical, in that it locates itself within critical currents within both psychology and ecology. Its method is interpretive and rhetorical, understanding the human-nature relationship in a way that normal science cannot and arguing for concerns counter to those of the dominant social order.

My own version of ecopsychology, "naturalistic psychology," asserts that to be claimed by the natural order means to belong to it, to be limited by it, and to feel its demands within our bodily experience. Naturalistic psychology advocates fidelity to nature, being in service of nature, and cultivating our inherent relations with a more-than-human world. This calls for a countering of the dominant pattern of our technologized and economized society. The general advance of technology leads not to the fulfilment of our nature but to a natural rebellion that the ruling powers of our society must constantly turn to advantage, administer, or out-manuever. The radical task is to recognize the suffering intrinsic to the modern enterprise and to create loving contexts for the bearing of this suffering. Thus may we both discover what our suffering means and work toward a society more congruent with and respectful of our nature and our experience. The advisor was Mora Campbell. This thesis has been published as Radical Ecopsychology: Psychology in the Service of Life (Albany, State University of New York Press, 2002); see that entry. (v.13,#4)

Fisher, Christopher L., "Animals, Humans and X-Men: Human Uniqueness and the Meaning of Personhood," Theology and Science 3 (no., 3, 2005): 291-314. Several critical boundary areas between humans and animals are examined for scientific evidence about human distinctiveness. These include communication and language capacity, cultural creativity, spirituality, and ethical capacity. Aspects of human uniqueness are apparent, can be fruitfully encompassed in the idea of personhood, and are coherent with Trinitarian theology's anthropological focus. Fisher is at Asbury Theological Seminary, Wilmore, KY.

Fisher, John A. "Taking Sympathy Seriously." Environmental Ethics 9(1987):197-215. Sympathy for animals is regarded by many thinkers as theoretically disreputable. Against this I argue that sympathy appropriately underlies moral concern for animals. I offer an account of sympathy that distinguishes

sympathy with from sympathy for fellow creatures, and I argue that both can be placed on an objective basis, if we differentiate enlightened from folk sympathy. Moreover, I suggest that sympathy for animals is not, as some have claimed, incompatible with environmentalism; on the contrary, it can ground environmental concern. Finally, I show that the traditional concept of anthropomorphism has no coherent basis, and I argue that the attempt to prove that animals lack thoughts is both unsuccessful and irrelevant to sympathy for languageless creatures. Fisher is in the department of philosophy, University of Colorado, Boulder, CO. (EE)

Fisher, Jonathan, "To Ban or Not to Ban?" (Ivory) International Wildlife 27(no. 3, May/June 1997):36-37. Nations are meeting in June to consider whether to continue the international ban on the sale of ivory, enacted in 1989. The ban has been quite effective. In the 1980's poachers slaughtered more than 70,000 elephants annually, a mortality 20 times what the continent-wide elephant population could sustain. The ban cut poaching by 90%. African elephants live in 35 countries. Some nations want to trade legal ivory, especially Zimbabwe, Botswana, Namibia, and Malawi. Ivory trade, they say, will generate income for conservation and it is cultural imperialism for developing nations to impose their standards on developing nations. Ban advocates reply that it is impossible to tell legal from illegal ivory, that legal sale will return the illegal sale, that conservation funds in often corrupt governments will fail to be so used, and that the impetus for banning ivory originally came from the African nations, is supported by the majority of them, and that the pro-trade nations themselves are just as guilty of forcing their views on others. (v8,#2)

Fisher, Mark, Review of Ben Mepham, ed., Food Ethics, Environmental Values 7:(1998):375.

Fisher, Mark, "New Zealand farmer narratives of the benefits of reduced human intervention during lambing in extensive farming systems," Journal of Agricultural and Environmental Ethics 16(2003):77-90. Easy-care or natural lambing pertains to those sheep able to successfully lamb and rear at least one lamb without human assistance in a difficult environment. Such sheep may have a higher survival rate, lower lamb mortality, and require less shepherding at lambing than other sheep breeds or strains. The farmer or shepherd account of easy-care lambing reveals several themes. Firstly, stock were bred to survive or suit local environments or conditions, particularly steep hill country in New Zealand. This involved extensive culling of undesirable dams, regardless of how well they might perform in traits other than the ability to survive and to produce live lambs at weaning. Sheep that did have problems were often assisted, recorded or marked and then culled at an appropriate time; thus both artificial (culling) and natural selection were used. Secondly, natural selection enabled the important traits to be identified and they were subsequently incorporated into artificial selection programs. Thirdly, the practice was necessitated by the impracticality of supervising lambing in difficult terrain and the cost of skilled farm labor. Finally, it was acknowledged that disturbance at lambing created problems and most importantly, the easy-care approach reduced some of the problems traditionally associated with lambing. Easy-care lambing systems thus aim to minimize some of the detrimental effects associated with carefully supervised lambing in some environments, by selecting sheep to suit both that environment and modern farm management. They overcame pervasive influences our cultural legacy was exerting on the way we interact with animals, and may have produced a system more in keeping with the biology of the animal in an extensive environment.

KEY WORDS: easy-care, farmer, farm magazines, lambing, shepherd. (JAEE)

Fitzhugh, T. W. and Richter, B. D., "Quenching Urban Thirst: Growing Cities and Their Impacts on Freshwater Ecosystems," BioScience 54(no. 8, 2004): 741-754(14). The development of water resources to satisfy urban water needs has had serious impacts on freshwater ecosystem integrity and on valuable ecosystem services, but positive trends are emerging that point the way toward a solution. We demonstrate this through case studies of water resource development in and around five large urban areas: Los Angeles, Phoenix, New York, San Antonio, and Atlanta. Providing freshwater ecosystems with the water flows necessary to sustain their health, while meeting the other challenges of urban water management, will require greatly increased water productivity in conjunction with improvements in the degree to which planning and management take ecosystem needs into account. There is great potential for improvement in both these areas, but ultimately water planners will also need to set limits on human alterations to river flows in many basins in order to spur greater water productivity and protect ecosystem water allocations before water supplies become overtaxed. (v.14, #4)

Fitzhugh, Thomas W; Richter, Brian D, "Quenching Urban Thirst: Growing Cities and Their Impacts on Freshwater", BioScience 54 (no. 8, 1 August 2004):741-7154(14). Fitzpatrick, William J., "Valuing Nature Non-Instrumentally," Journal of Value Inquiry 38(2004):315-332. In addition to valuing nature instrumentally, humans can also value nature because such valuing is constitutive of flourishing human life. "We ought to value at least some natural things and places non-instrumentally because they in fact have non-instrumental value, due to their irreplaceable, constitutive role in fully flourishing human life." A "closely analogous" relationship is human friendship. We do not value friends instrumentally but because

"friends are fundamental non-instrumental goods in human lives, due to their irreplaceable role in fully flourishing human life" (p. 329). This relationship is not pragmatic, nor does it need to posit intrinsic value in nature. Fitzpatrick is in philosophy, Virginia Polytechnic Institute, Blacksburg, VA.

FitzPatrick, William J. "Climate Change and the Rights of Future Generations: Social Justice Beyond Mutual Advantage." Environmental Ethics 29(2007):369-388. Despite widespread agreement that we have moral responsibilities to future generations, many are reluctant to frame the issues in terms of justice

and rights. There are indeed philosophical challenges here, particularly concerning non-overlapping generations. They can, however, be met. For example, talk of justice and rights for future generations in connection with climate change is both appropriate and important, although it requires revising some common theoretical assumptions about the nature of justice and rights. We can, in fact, be bound by the rights of future people, despite the "non-identity problem," and the force of these rights cannot be diluted by "discounting" future costs. Moreover, a rights-based approach provides an effective answer to political arguments against taking mandatory measures to curb greenhouse gas emissions when these are unpopular with a democratic populace. (EE)

Fitzsimmons, Allan K., Defending Illusions: Federal Protection of Illusions. Lanham, MD: Rowman and Littlefield, 1999. A synopsis is "The Illusion of Ecosystem Management," PERC Reports 17 (no. 5, December 1999):3-5. The main problem is that ecosystems are not real. "Ecosystems are only mental constructs, not real, discrete, or living things on the landscape. They do not breathe, emerge from wombs, or spring from seeds. They are not real, organized entities consciously seeking to perpetuate themselves against internal or external threats to their existence" (p. 4). The second problem is that, even if they were real, we have no idea of what their "health" or "integrity" might mean. There are some further problems, such as the "wooliness" of the ideas of "ecologist Bryan Norton" about ecosystem health and creativity. Fitzsimmons is a geographer and environmental analyst, president of Balanced Resource Solutions, a consulting firm in Woodbridge, Virginia (and no doubt also unreal, since consulting firms are mental constructs and do not breathe, emerge from wombs, or spring from seeds). Fjellstrom, Roger, "Is Singer's Ethics Speciesist?" Environmental Values 12(2003): 71-90. To show favouritism toward humans has been considered a prejudice, otherwise known as 'human chauvinism', 'anthropocentrism' or 'speciesism'. Peter Singer is one philosopher in particular who holds this view. In this paper I argue that there is a lack of coherence between his ethical ideology and his actual ethical theory. Singer's ethics in crucial respects exhibits favouritism toward humans, which is something he fails to justify non-partially and plausibly. It would thus be an instance of speciesism, in a sense of this term that he probably would accept. This, however, does not mean that his ethics should be rejected or is impossible to defend.

Zwart, Hub, "Aquaphobia, Tulipmania, Biophilia: A Moral Geography of the Dutch Landscape," Environmental Values 12(2003): 107-128. In Genesis (1:9-10) we are told that God gathered the waters into one place, in order to let the dry land appear, which He called earth, while the waters were called

seas. In the Netherlands, this process took more than a single day, and it was the work of man. Gradually, a cultivated landscape emerged out of diffuse nature. In the course of centuries, the Dutch determined the conditions that allowed different aspects of nature to present themselves. This process is described as a moral geography in the sense that different types of landscape are read as a manifestations (or materialisations) of different moral attitudes towards nature, whereas concrete landscape interventions are interpreted as instances of moral criticism directed towards the activities and values of previous generations. At present, this process (the genesis of the Dutch landscape) is being reversed, as diffuse, wetland nature is experiencing a come-back. (EV)

Fjellstrom, Roger, "Specifying Speciesism," Environmental Values 11(2002):63-74. Many philosophers consider favouritism toward humans in the context of moral choice to be a prejudice. Several terms are used for it - "speciesism", "human chauvinism", "human racism", and "anthropocentrism" - with somewhat varying and often blurred meanings, which brings confusion to the issue. This essay suggests that only one term, "speciesism", be used, and it attempts a conceptual clarification. To this end it proposes a set of conditions of adequacy for a concept that would be acceptable to the parties of the controversy. Through an examination of various forms of alleged speciesism it eventually proposes a rather precise concept. On this definition some positions believed not to be speciesist perhaps should be so called, and some positions believed to be speciesist perhaps should not be so called. The latter would better be referred to as "humanistic ethics" or "non-speciesist humanism". (EV)

Fjellstrom, Roger. "Equality Does Not Entail Equality across Species." I critique Peter Singer's view that equality across species is a natural extension of equality. Singer presents one minor and two major arguments. The first major argument is that equality across species is implied by the traditional principle of equality. The second is that it follows from a conception that is behind the principle of equality, namely the moral "point of view of the universe." The minor argument is a theory of the altruistic character and expanding circles of ethics. Environmental Ethics 24(2002):339-352. (EE)

Flood, Ann Margaret. Eco-morality: The Extension of Moral Development Theory to an Environmental/Ecological Context and the Development of the Flood Relative Presence Scoring Method to Assess Gender-biased Differences in Moral Orientation. Ph.D. dissertation in psychology at the Fielding Institute, 1992. Eugene Kerfoot was the chief advisor. Investigates the theoretical extension of Kohlberg's moral development theory from the anthropocentric context to an environmental context in terms of care and justice orientations of moral development theory. A new scoring method, the "Flood Relative Presence Scoring Method" is developed to assess more accurately the relative presence of moral orientations. Gender differences found in responses to human moral dilemmas were also found in environmental dilemmas. There is strong evidence that present moral development theory is incomplete, as well as unnecessarily limited to the human domain. With substantial reviews of the field of environmental ethics. (v6,#3)

Flores, Dan, "Bison Ecology and Bison Diplomacy: The Southern Plains from 1800-1850," Journal of American History 78(1991):465-485. Flores claims that the southern plains native Americans, after they got horses from the Spanish, and even before they got guns, within a century were exploiting the bison so effectively that the herds were seriously declining. Soon many Indians were starving; and, even without the Europeans, the bison would well have been driven to extinction before 1900. So much for the myth of the Indian as a good ecologist. In fact, the native American religion contributed to the crisis, since plains Indians believed that buffalo were produced supernaturally every spring in countless numbers in a country

under the ground and swarmed like bees out of a hive from cave openings in unknown locations. Flores teaches environmental history at Texas Tech University. (v9,#2)

Flournoy, Alyson C., "Section 404 at Thirty-Something: A Program in Search of a Policy," Alabama Law Review 55(No. 3, Spring 2004):607-649. In 2002, as the Clean Water Act turned thirty, the program that regulates the discharge of dredged and fill material into water and wetlands was beset by a familiar turbulence, involving fights over the significance of the ordinary high water mark, the meaning and proof required to demonstrate a "hydrologic connection," mitigation requirements, and others. Over the years, both governmental and non-governmental reports have highlighted the persistent gaps in knowledge, enforcement, monitoring, funding, and interagency coordination under section 404, and the attendant disappointing results. Flournoy is in law, University of Florida.

Flournoy, Alyson C., "In Search of an Environmental Ethic," Columbia Journal of Environmental Law 28(no. 1, 2003):63-118. There is a massive corpus of environmental law, but "it is not clear that environmental laws do reflect any clearly articulated ethic that should be called environmental. As a nation we lack an adequate understanding of the values that undergird these laws. ... It is time we ask ourselves those obvious, but frequently overlooked questions. Are our environmental laws simply extensions of the ethical structure of our tort, property and criminal law, designed to protect person and property from certain insults not adequately addressed under the pre-existing common law? Or are they 'environmental laws' in another sense, in that they embody a special valuing of the environment?"

Long article, includes summaries of environmental ethics as a philosophical discipline and whether and how far there is a connection with environmental law. Benefits to be realized from a more adequate study of the ethics embedded in environmental law. Flournoy is in law, University of Florida. (v 14, #3)

Flournoy, Alyson C., "Building an Environmental Ethic from the Ground Up," U.C. Davis Law Review 37(No. 1, Nov. 2003):53-80. Unearthing the ethics embodied in environmental law. To what extent have theories in environmental philosophy had a practical impact on environmental law and policy. Environmental law cannot and will not succeed unless there is strong public commitment to conserving nonhuman nature. Environmental law will not endure or have lasting effect unless environmental philosophy does come down to earth. Such work is vitally important for the future of environmental law as well as for the success of environmental philosophy itself. The American public lacks a coherent account of the values we now pursue under our current environmental laws. Philosophers and legal scholars can help to bring philosophy down to earth by developing "stepping stones" to invoke concepts that represent marginal or gradual change from the dominant human-centered utilitarian ethical framework, as opposed to radically divergent theories of environmental ethics, such as biocentric intrinsic value theory. Sustainability is such a stepping stone. Excellent and thoughtful article linking environmental philosophy and environmental law. Flournoy is in law, University of Florida.

Flournoy, Alyson C., "Beyond the 'Spotted Owl Problem': Learning from the Old-Growth Controversy," Harvard Environmental Law Review 17(no. 2, 1993):261-332. The author considers at extensive length the claim that there is a "spotted owl problem," (that environmental laws, including those protecting endangered species, are too strong and need to be revised to accommodate human welfare and economic

interests), and rejects efforts to weaken or bypass existing laws. Current statutes may, however, be inefficient and risky where legislation intended for the protection of a single species is used to try to protect ecosystems as a whole, such as old-growth forests. The Endangered Species Act is not the problem its detractors claim it to be. On the contrary, the promotion of economic activities inconsistent with widespread ecological values in the absence of effective laws addressing conservation of land and natural resources is the real problem. The challenge is to adapt the law and economic policy to the reality of important ecological constraints. More and better laws alone cannot resolve the problem, however, since gaps in the laws "partly reflect a struggle to find an agreeable environmental ethic on which to build policy. Only with a clearer ethical vision of appropriate preservation goals can better laws be shaped." Thorough and insightful article. Philosophers who think that lawyers do not do their philosophical homework should read this article. Flournoy teaches law at the University of Florida. (v5,#4)

Folke Carl, and Colding, Johan, "Traditional Conservation Practices," Encyclopedia of Biodiversity 5: 681-694. People have inhabited terrestrial ecosystems for thousands of years. Both resource management systems and cosmological belief systems have evolved and continue to develop. In fact, most, if not all, ecosystems and biodiversity have been altered by humans to various degrees. The human imprint has in many cases wiped out species and caused substantial land use change. However, some traditional and contemporary practices do contribute to biodiversity conservation. (v.11,#4)

Folse, Henry J., Jr. "The Environment and the Epistemological Lesson of Complementarity." Environmental Ethics 15(1993):345-53. Following discussions by Callicott and Zimmerman, I argue that much of deep ecology's critique of science is based on an outdated image of natural science. The significance of the quantum revolution for environmental issues does not lie in its alleged intrusion of the subjective consciousness into the physicists' description of nature. Arguing from the viewpoint of Niels Bohr's framework of complementarity, I conclude that Bohr's epistemological lesson teaches that the object of description in physical science must be interaction and that it is now mistaken to imagine that physical science aims to represent nature in terms of properties it possesses apart from interaction. Folse is in the department of philosophy, University of Loyola, New Orleans, LA. (EE)

Foltz, Bruce V. "On Heidegger and the Interpretation of Environmental Crisis." Environmental Ethics 6(1984):323-38. Through an examination of the thought of Martin Heidegger, I argue that the relation between human beings and the natural environment can be more radically comprehended by critically

examining the character of the relation itself with regard to how it has been shaped and articulated by the tradition of Western metaphysics, particularly in light of the manner in which this tradition contains the central presuppositions of both modern natural science as well as contemporary technology. I conclude with an examination of a "deconstructive analysis" of the concept of nature that has dominated Western philosophy; with a delineation of an alternative understanding of the environment, that is nevertheless deeply rooted in the Western tradition, and with a proposal that the present "environmental crisis" ultimately derives not from certain Judeo-Christian "values," as it is commonly claimed, but from the initial metaphysical orientation of early Greek philosophy. Foltz is in the department of philosophy, University of Dallas, Irving, TX. (EE)

Foltz, Bruce V., "On Heidegger and the Interpretation of Environmental Crisis," Environmental Ethics 6(1984):323-338. An examination of Heidegger that shows that the environmental crisis has its roots in Western metaphysics. The central conceptions of natural science and technology objectified nature, thus preventing its own "self-emergence."

Foltz, Bruce V. Inhabiting the Earth: Heidegger, Environmental Ethics, and the Metaphysics of Nature. Atlantic Highlands, NJ: Humanities Press, 1995. Through a comprehensive study of the status of "nature" and related concepts such as "earth" in the thought of Heidegger, Foltz attempts to show how Heidegger's understanding of the natural environment and our relationship to it offers a more promising basis for environmental philosophy than others that have been put forward. Foltz is at Eckerd College, St. Petersburg, Florida. (v7,#1)

Foltz, Richard C., "Iran's Water Crisis: Cultural, Political, and Ethical Dimensions," Journal of Agricultural and Environmental Ethics 15(no. 4, 2002):357-380. By the summer of 2001, most of Iran had been suffering a three-year drought, the worst in recent history. Water rationing was in place in Tehran and other cities, and large proportions of the country's crops and livestock were perishing. Yet

many academics and other experts in Iran insist that the water crisis is only partly drought-related, and claim that mismanagement of water resources is the more significant cause. Underlying this discussion is a complex of overlapping yet often conflicting ethical systems--Iranian, Islamic, and modernist/industrialist--which are available to inform water policy in Iran. A review of the various arguments about the nature of the crisis and the range of solutions that have been proposed, including precedents from traditional Iranian water management and the ethics of water use in Islamic law, suggests that Iran's own cultural heritage provides alternatives to wholesale adoption of Western models. KEY WORDS: Iran. Islamic law. qanat, sustainable development, water management, Zoroastrianism. Foltz is in the Department of Religion, University of Florida, Gainesville, FL. (JAEE)

Foot, Philippa, Natural Goodness. Oxford: Clarendon Press, 2001. "'Natural' goodness, as I define it, which is attributable only to living things themselves and to their parts, characteristics, and operations, is intrinsic or 'autonomous' goodness in that it depends directly on the relation of an individual to the 'life form' of its species. On barren Mars there is no natural goodness" (p. 27). "The central feature of my own account is that it will set the evaluation of human action in the wider contexts not only of the evaluation of other features of human life but also of evaluative judgements of the characteristics and operations of other living things" (p. 25).

"I am therefore, quite seriously, likening the basis of moral evaluation to that of the evaluation of behavior in animals. I should stress, however, that it is important not to underestimate the degree to which human communication and reasoning change the scene. The goods that hang on human cooperation, and hang too on such things as respect for truth, art, and scholarship, are much more diverse and much harder to delineate than are animal goods. Animals are different also from us in that to do what they should do--what is needed and is within their capacity--they do not have to understand what is going on; whereas a human being can and should understand that, and why, there is a reason for, say, keeping a promise or behaving fairly" (p. 16). Forbes, Linda C. & Jermier, John M. "The Institutionalization of Bird Protection: Mabel Osgood Wright and the Early Audubon Movement", Organization and Environment, 15, (No. 4, 2002): 458-474. The authors focus on a relatively unknown segment of the early American conservation movement, examining the period around 1900, a time in which birds were being slaughtered at an alarming rate, in part to supply milliners who used plumes and other bird parts to decorate women's hats. These practices led to a groundswell of opposition that eventually turned the tide in favor of bird protection and appreciation, forming a foundation for today's activism on behalf of beleaguered birds. One of the key leaders of this movement was Mabel Osgood Wright, who like many significant conservationist women of that era is only now beginning to receive the recognition that she deserves. The authors highlight three major projects to which Wright devoted her energy, namely the early Audubon Society, children's nature writing and education, and the Birdcraft Sanctuary, and discuss them as institutional manifestations of the early conservationists' bird-loving philosophy. Extracts from three of Wright's most important publications are also reprinted, in order to provide relevant insights for contemporary environmental protection and organizing. Forbes is an assistant professor in Franklin & Marshall College, Lancaster, Pennsylvania, with interests in cultural studies, environmental philosophy and history, and a feature editor of Organization and Environment. Jermier is professor of organizational behavior in the College of Business at the University of South Florida, and editor of Organization and Environment.

Forbes, Malcolm, S., Jr., "People Are an Asset, not a Liability," Forbes, September 12, 1994. An editorial. At the Cairo conference, "the real issue is that curbing population growth is critical for economic development. That premise is preposterous. A growing population is not a drag on economic development. When combined with freedom, it is a stimulant." The richest countries in the world are the most densely populated, and people are poor only where governments dominate and suffocate economic

activity. "A growing population helps improve the quality of life." "Free people don't 'exhaust' resources; they create them."

Forsberg, Ellen-Marie, "Pluralism, The Ethical Matrix, and Coming to Conclusions," *Journal of Agricultural and Environmental Ethics* 20(2007):455-468. The ethical matrix approach was developed by Prof Ben Mepham and his colleagues at the University of Nottingham in the early 1990s. Since then the approach has received increasing attention and has been used by several researchers in different projects related to assessing ethical impacts of different food production technologies and other policy options of societal concern. The ethical matrix is sometimes understood simply as a checklist of ethical concerns, but might also be seen as a guide to coming to conclusions on moral questions. The problem I discuss in this paper relates to how using the ethical matrix method as a decision guide can be combined with respecting pluralism. The aim of the paper is to suggest a framework making it possible to - at the same time - enhance public justification of judgments and respect pluralism. I argue that pluralism is fundamental to the ethical matrix approach; I distinguish between intuitionist *principled pluralism* and societal *value pluralism*; and I show how both kinds of pluralism imply restrictions on how conclusions can be made. No substantive moral decision principles can be allowed. Still, I argue, decision principles of a more epistemological or procedural character can be acceptable even within pluralism. The pragmatist principle of inquiry is defended as an account of moral problem solving compatible with both principled pluralism and value pluralism. When an ethical matrix is used within such a participatory inquiry process substantive conclusions can be drawn.

Forsberg, Ellen-Marie, "Value Pluralism And Coherentist Justification of Ethical Advice," *Journal of Agricultural and Environmental Ethics* 20(2007):81-97. Liberal societies are characterized by respect for a fundamental value pluralism; i.e., respect for individuals' rights to live by their own conception of the good. Still, the state must make decisions that privilege some values at the cost of others. When public ethics committees give substantial ethical advice on policy related issues, it is therefore important that this advice is well justified. The use of explicit tools for ethical assessment can contribute to justifying advice. In this article, I will discuss one approach to ethical assessment, the ethical matrix method. This method is a variant of intuitionist balancing. Intuitionism is characterized by stressing the existence of several (at least two) fundamental *prima facie* moral principles, between which there is no given rank order. For

some intuitionist approaches, coherentism has been proposed as a model of justification. This article will discuss justification of ethical advice and evaluate the appropriateness of coherentism as a justificatory approach to intuitionist tools. Keywords: coherentism - ethical matrix - ethical tools - intuitionist balancing - justification - prima facie principles - value pluralism. Forsberg is with the The National Committees for Research Ethics, Sentrum, Oslo, Norway.

Foster, Cheryl, Aesthetics and the Natural Environment. Ph.D. dissertation at the University of Edinburgh, Department of Philosophy. 1993. Advisor: Ronald Hepburn. Foster claims that most

contemporary aesthetics of nature relies on either of two models, one based on art history and criticism, the other based on scientific categories and interpretation. Most accounts cling magnetically to one pole or the other. Either the aesthetic power of nature emerges by analogy or in association with art and its concomitant history and criticism; or, nature's beauty is seen to be properly understood only in deference to scientific knowledge or hypothesis. Neither approach can fully articulate the relationship between natural beauty and ourselves, the beings who encounter it.

Foster holds that Kant and Schopenhauer have been particularly misrepresented with regard to natural beauty and finds them productive for a theory of environmental aesthetics. She continues to develop a theory that is bound by neither art nor science. She examines the role of non-perceptual factors and of ethical and other constraints on aesthetic appreciation (with attention to Allen Carlson). The difference between aesthetic qualities (Sibley) and aesthetic properties (Mothersill) is analyzed in order to defend the idea that aesthetic judgements are singular and not governed by rules or principles. Nature's multi-sensuousness is involved in discerning relevant aesthetic properties. Andrew Brennan's ecological humanism is a useful model. Both the art-based and the science-based models of natural beauty are interesting and relevant, but neither is comprehensive enough to represent the range of concerns in environmental aesthetics. Foster is in the department of philosophy at the University of Rhode Island. (v4, #3)

Foster, Cheryl. "Aesthetic Disillusionment: Environment, Ethics, Art." Environmental Values Vol.1 No.3(1992):205-216. ABSTRACT: What happens when an object you take to be beautiful or aesthetically pleasing, no longer appears beautiful or pleasing when you learn something new about it? I am assuming a situation in which there is no direct change in the perceptual features of the object, and that what you learn is not the location of some new surface property but rather a bit of non-perceptual information. I classify episodes of dampened appreciation under the heading 'aesthetic disillusionment,' and in this paper I explore the relationship between such episodes and the broader issue of ethical constraints on aesthetic activity and appreciation. Does it make sense to say that one should not, or ought not, take pleasure in certain objects or events? I think it does--but in a very particular, almost ecological way. The subsequent discussion focuses on ethical constraints as they operate on the aesthetic appreciation of objects and events within the natural environment. KEYWORDS: Environmental aesthetics, life-denying processes, life values, nature and art. Philosophy Department, University of Rhode Island, Adams Hall, Kingston, RI 02881-0813, USA.

Foster, David R., Thoreau's Country: Journey through a Transformed Landscape. Cambridge: Harvard University Press, 1999. Thoreau had to hunt for some wildness on a largely transformed, agrarian landscape. But already New England farmers were being outcompeted by Mid-West farmers and many fields were being abandoned, and Thoreau's journals are full of observations of returning wildness. One observation is that farmers let cattle continue to graze on disused fields, and this may have accelerated the growth of pines over hardwoods, although pines do naturally return first to open fields. The returned

forest in New England may be a peculiarly New England product. Foster is director of the Harvard Forest. (v.10,#1)

Foster, David R., and John D. Alber., eds., Forests in Time: The Environmental Consequences of 1,000 Years of Change in New England. New Haven: Yale University Press, 2004. Mostly the story of the Harvard Forest, though with wider implications. Climatic and vegetation changes, natural disturbances (such as hurricanes, pests, and pathogens), the impacts of Native Americans and fire, the history of land use and landscape transformation, present-day changes, and introduced pests and species. The return of forests in the last century, from about 40 percent to 60 to 90 percent of the landscape. One conclusion is that the present forest results from much human impact, but another conclusion, in some tension with this, is that the forest returns quite quickly and vigorously. (v.14, #4)

Foster, Leeann, "Wildlands and System Values: Our Legal Accountability to Wilderness," Vermont Law Review 22 (no. 4, summer 1998):917-951. "The paradox that is the modern American has given rise to the conflicting values that are embodied in wilderness law. Having outgrown, to a certain extent, notions that wild nature exists solely as something to be conquered, we encouraged our leaders to preserve what we once freely enjoyed, because after having enjoyed so much of it, we were loath to watch it disappear. The Wilderness Act manifests this reluctance. ... What the Wilderness Act did not do, however, was to consider the systems-character of the wild lands it set aside. ... An ecosystems or transboundary approach to wilderness preservation through which systems accountability to wild lands is achieved will likely not pass quietly into law" (pp. 950-951). Foster is now practicing environmental law in New Jersey. She finished Vermont Law School in 1998 and in 1994 a M.A. in environmental philosophy at Colorado State University. (v.9,#4)

Foster, Leeann, The Self in Environmental Philosophy: Identification, Intrinsic Value and an Ecology of Self and Nature, M. A. thesis at Colorado State University, spring 1994. Foster examines the deep ecological concept of self in comparison and contrast with the environmental ethical concept of self. Deep ecologists, such as Warwick Fox and Freya Mathews, expand the self into an identification with the whole, while environmental ethicists, such as Holmes Rolston, maintain a sense of others, centers of intrinsic value in the nonhuman natural world, who are morally considerable as others, differentiated from one's own self, and to whom one has duties of respect. Nevertheless the deep ecologists can find a place for pluralism and Rolston's ethic is based as much on love as it is on duty. Both ways of thinking are contrasted with the traditional concept of the autonomous self, represented by Kant. (v5,#1)

Foster, Susanne E. "Aristotle and the Environment." There are three potential problems with using virtue theory to develop an environmental ethic. First, Aristotelian virtue theory is ratiocentric. Later philosophers have objected that Aristotle's preference for reason creates a distorted picture of the human good. Overvaluing reason might well bias virtue theory against the value of non-rational beings. Second, virtue theory is egocentric. Hence, it is suited to developing a conception of the good life, but it is not suited to considering obligations to others. Third, virtue theory is notoriously bad at providing rules and procedures for resolving ethical questions about particular circumstances. But environmentalists need procedures for determining which of several conflicting values is most important. Virtue theory is not action guiding. I respond to each of these problems. I show that virtue theory is uniquely suited to answering ethical questions about nonhuman animals and the environment. Environmental Ethics 24(2002):409-428. (EE)

Fox, Michael Allen. "Vegetarianism and Planetary Health." Ethics and the Environment 5(2000):163-174. I begin by asserting that a vegetarian, even a vegan diet, from a nutritional standpoint, is at least as healthy as, and in all probability healthier than, one which centers on or includes meat. Scientific evidence supporting this claim is beginning to accumulate, and abundant material is available for those who wish to pursue the issue (Anonymous 1988a; Anonymous 1988b; Barnard 1993; Chen 1990; Melina, Davis, and Harrison 1994; White and Frank 1994). In addition, every good bookshop today has several vegetarian and/or vegan cookbooks, and many titles currently on the market contain excellent chapters on the fundamentals of vegetarian nutrition as well as references to contemporary nutritional research. For these reasons I shall not attempt to summarize here the evidence in favor of a vegetarian diet. My second preliminary claim is that meat-eating in general is, and in particular certain kinds of meat-eating are, unhealthy. The statistical correlation between high meat consumption and increased probability of colon, breast, and other cancers. heart disease, and atherosclerosis--far and away the leading causes of death in North America--has been well established by many independent researchers (Barnard 1990; Fiddles 1991; Mitra 1991; National Research Council 1989; Robbins 1987). This realization prompted Health and Welfare Canada (a federal government department) to issue a new version of Canada's Food Guide to Healthy Eating, which appeared in 1992. Alternatives to meats (such as tofu and legumes) are accentuated, as are 5-10 servings per day of vegetables and fruits and 5-12 servings per day of grain products. Critics maintain that an even greater shift toward a vegetarian diet might have been endorsed in the Guide had it not been for the extraordinary (and entirely predictable) behind-the-scenes lobbying efforts of the livestock industry ("Industry Forced Changes" 1993). Fox argues for a panentheism; God is both transcendent to and imminent in the world. "Fundamentally, there is but one crisis--and it is a spiritual one" (p. 87). Even though respect for animals and the natural environment is evident throughout history and in all the world's major religions, it has been lost over time. The world has been desacralized, the ugly effect of "the materialism of both state and private capitalism, along with its industrialism, scientific imperialism, and shallow priesthood of instrumented rationalists" (p. 150). Fox is the vice-president of the Humane Society of the United States. (v7,#4)

Fox, Michael Allen, Deep Vegetarianism. Philadelphia: Temple University Press, 1999. A vegetarian diet is related to our larger worldview and to our comprehensive code of ethics. Good health, suffering, environmental impacts of meat production, the meaning of food, world hunger, religion and spirituality,

ideologies, including feminism, human nature, humans as carnivores--the vegetarian issue is linked with many other issues that figure in our view of life. Fox is in philosophy, Queen's University, Kingston, Ontario, and was once an outspoken advocate for animal experimentation. (v.10,#1)

Fox, Michael Allen. "Nuclear Weapons and the Ultimate Environmental Crisis." Environmental Ethics 9(1987):159-179. Current philosophical debate on the arms race and on the use of nuclear weapons tends to focus on the rationality and morality of deterrence. I argue, however, that in view of recent scientific findings concerning the possibility of nuclear winter following upon nuclear war, or of some lesser but still massive consequences for nature, the perspective of environmental ethics is one from which nuclear war and preparations for it ought to be examined and condemned. Adopting a "weak anthropocentric" position of the sort advocated by Bryan Norton and others, I argue that it is the extinction or decimation of the human species that should be our central concern, but that even without ascribing intrinsic value to nature, natural objects and nonhuman organisms, the destruction or decimation of the environment provides additional grounds for judging nuclear war to be immoral and unthinkable. Transpersonal ecology represents a creative meeting ground between environmental philosophy and transpersonal psychology. It brings together the psychologist's understanding of the self beyond personal ego with the ecologist's belief in the inherent value of all living things. An in-depth analysis of the deep ecology movement. Fox is a National Research Fellow at the Center for Environmental Studies at the University of Tasmania. (v1,#3)

A major discussion of the philosophy of deep ecology by one of its leading advocates. For the last ten years, Fox has been a prolific commentator and defender of the philosophy of Arne Naess, and this book (an expansion of his doctoral dissertation) is the first complete expression of his views. Fox sees a connection between the deep ecology emphasis on "identification" and recent work in "transpersonal psychology"---thus he changes the name of "deep ecology" to "transpersonal ecology."

For Fox, "Naess's philosophical sense of deep ecology...refers to a psychologically based approach to the question of our relationship with the rest of nature" (p. 197). Fox's view of Naess is in contrast to the standard interpretation of deep ecology as an ethical or axiological theory. Fox provides an in-depth analysis of Naess's three senses of deep ecology: (1) formal derivation of principles; (2) philosophical sense of self-realization; and (3) popular sense of eco-centrism. More importantly, he discusses the place of deep ecological thought in environmental philosophy generally, and evaluates the criticisms of opponents. Although Fox is correct in moving beyond the axiological side of deep ecology, he places too much emphasis on psychological "identification" with the natural world; the most justifiable sense of deep ecology is as an ontological and phenomenological description of the world. See Naess, below. The book contains an excellent bibliography and exhaustive footnotes. (Katz, Bibl # 2) Reviewed in Environmental Ethics 15(1993):181-83.

Fox, Warwick, "The Deep Ecology-Ecofeminism Debate and Its Parallels," Environmental Ethics 11(1989):5-25. A defense of deep ecology against the attack by ecofeminism---here defined as the charge that deep ecology is too concerned with anthropocentrism and not the real villain, androcentrism. Fox argues that the ecofeminist criticism is too simplistic, for a whole range of human social classes have been the agents of domination. A concern for androcentrism is another variation of the same old theme that humans have to put their own house in order first. The main point is that deep ecology is not anti-human, but anti-human centeredness. But it is questionable whether an ethic can be against anthropocentrism and not be anti-human. Readers should remember Callicott's assertion in "Animal Liberation: A Triangular Affair" that misanthropy is a mark of biocentrism (Environmental Ethics 2 (1980): 326). (Katz, Bibl # 2)

Fox, Warwick, "On the Interpretation of Naess's Central Term, 'Self-Realization,'" The Trumpeter 7:2, Spring 1990. Fox argues that Naess's "self-realization" can be interpreted either in the axiological direction of objective intrinsic value in natural entities or in the identification direction of a psychological experience of cosmological unity. According to Fox, Naess really prefers the identification direction. On the axiological view, "One ought to protect all living beings ... on account of the fact that they are morally considerable (i.e. intrinsically valuable). In contrast, in Naess's formulation ..., one arrives at the view

that one wants to protect all living beings on account of the fact that one feels deeply identified with them." "What is basic for deep ecologists is the psychological capacity for, and the experience of, wide and deep identification." "At a philosophical or argumentative level, the main writers on deep ecology have adopted an identification based approach in preference to an intrinsic value based approach." Fox is in the Department of Geography and Environmental Studies, University of Tasmania. (v1,#2)

Fox, Warwick, "Deep Ecology: A New Philosophy of Our Time?" The Ecologist vol. 14, nos. 5-6 (1984):194-200. With a Reply by Arne Naess, "Intuition, Intrinsic Value and Deep Ecology," pp. 201-203, and a further comment by Fox, pp. 203-204. A good summary expression of the Deep Ecology position. Fox cites three distinguishing marks of the philosophy, as opposed to "shallow" environmentalism: Human-environment unity; a critique of the dominant metaphysic--mechanistic materialism--with the realization that ecological ethics must be ontologically grounded; economic sustainability. But the strength of this essay is that Fox squarely faces some of the problems of Deep Ecology: its ultimate ground in intuition about the unity of the self and the natural environment, and its claim of "biospherical egalitarianism." Fox effectively jettisons the latter principle. In his rejoinder to Naess (p. 204) he draws important distinctions between the advocates of Deep Ecology, who are interested in developing an ecological consciousness, and environmental ethicists, who seek to justify an ethical system by means of argument. Deep Ecology is not based on rational argument. (Katz, Bibl # 1)

Fox, Warwick, ed., Ethics and the Built Environment, London: Routledge, 2000. 15 original papers, divided into three sections entitled: (1) The Green Imperative - and its Vicissitudes; (2) Building with Greater Sensitivity to People(s) and Places; (3) Steps Towards a Theory of the Ethics of the Built Environment. Just as traditional, anthropocentrically focused forms of ethics have exhibited a major blind spot in their theorising with respect to the nonhuman world, so the development of environmental ethics has thus far exhibited a major blind spot of its own. The world around us--what we call "the environment"--consists of both spontaneously occurring and humanly constructed environments. This natural/built environment distinction is perhaps the most obvious division that we can make in the day-to-day world in which we live. Yet, despite the fact that the world around us consists of both natural and built environments (and their various admixtures), environmental ethics, as a formal field of inquiry, has been overwhelmingly focused upon the spontaneously self-organising natural environment as opposed to the humanly created, or intentionally organised, built environment. Environmental ethics has not yet truly earned the name that it presently goes under. On the one hand, this bias towards concerns with the natural environment is completely understandable: environmental ethicists have wanted to escape the almost exclusively anthropocentric focus that has pervaded traditional ethical approaches. On the other hand, this bias is decidedly odd. Whereas humans evolved in natural, or spontaneously self-organising, environments, we now increasingly live in built, or intentionally organised, environments. (v.11,#4)

Fox, Warwick, "Approaching Deep Ecology: A Response to Richard Sylvan's Critique of Deep Ecology." Environmental Studies Occasional Paper 20 (University of Tasmania, 1986). The best explanation and defense of the Deep Ecology position, supplanting an earlier and shorter article by Fox, "Deep Ecology: A New Philosophy of Our Time?" Fox first attacks Sylvan's criticisms of Deep Ecology as being based on misrepresentations of the Deep Ecology position (see Sylvan). He then explains this position by focusing on the idea of "identification" with the natural environment. This is the new meaning now given by Fox to the Deep Ecologist primary value of "self-realization." Fox wants to delineate this "identification process" quite clearly; it does not imply a naive biocentric egalitarianism, a view in which every natural entity has equal intrinsic worth, for Deep Ecology denies the ontological independence of natural entities; nor does it imply an extreme holism, in which all entities lose their autonomy and individuality. Deep Ecology wants to take a middle path: deny human superiority, show the interrelatedness of all natural beings, and develop "self-realization," a consciousness which somehow identifies with nature (p. 69). Fox does not explicitly state what this identification process is; he concentrates on what it is not. It is not a search for "intrinsic value" in natural individual entities. That method is the "environmental axiological" approach, and it is insufficient for the development of environmental preservation. We have to change the "mode of discourse" in the analysis of environmental problems. "[T]aking the route of developing and applying formal, theoretical environmental axiological positions ... to our relationship with the nonhuman world is at best not helpful or misguided and at worst dangerous in that it can end up doing more harm than good. ... [S]upporters of deep ecology ... have deliberately chosen not to take the environmental axiological route" (p. 41). But is this mode of discourse rational? Does it degenerate into the "armchair mysticism" which Fox wishes to avoid (p. 66)? I cite as an example Fox's current rejection of his earlier criticism of bio-egalitarianism. One can only criticize bioegalitarianism if it is conceived as a specific environmental axiology. But it should not be so conceived. What then, is it? Apparently, a mere attitude, a rejection of anthropocentrism (pp. 39-40). But then the terminology used by Deep Ecologists is intellectual doubletalk. Fox is the clearest of all Deep Ecologists, but the vagueness and the anti-rationality of the central concepts of this position is frightening. (Katz, Bibl # 1)

Fox, Warwick. *A Theory of General Ethics: Human Relationships, Nature, and the Built Environment*. Cambridge, MA: MIT Press, 2006. Fox develops an ethical "theory of everything" that encompasses interhuman ethics, the natural environment, and the built environment. He argues that examples in any domain of interest exemplify a quality of responsive cohesion, and it is the relational quality of such cohesion that represents the most fundamental value there is. From this "theory of responsible cohesion," Fox develops a "theory of contexts" and a differentiated model of human obligations in respect of all beings. He tests his theory against eighteen central problems in ethics, including challenges raised by abortion, architecture, animal welfare, ecological management, euthanasia, invasive species, personal obligations, planning, and politics.

Fox, Warwick. "A Critical Overview of Environmental Ethics." World Futures (Amsterdam) 46 (1996): 1-21. A general introduction to, and a critical overview of, environmental ethics. There are three main human-centered or anthropocentric or instrumental value approaches: the unrestrained exploitation and expansionism approach, the resource conservation and development approach, and the resource preservation approach. There are three main nonanthropocentric or intrinsic value approaches: the sentience or animal liberation approach, the life approach, and the holistic integrity approach. Each is examined in terms of both rational foundations and practical consequences. Two of the latter approaches, the life approach and the holistic integrity approach, are based on flawed rational foundations. All three approaches suffer from a range of highly objectionable practical consequences and none of these approaches is comprehensive enough in scope to deal directly with the full range of environmental problems with which people are concerned on a day-to-day level. Despite the negative conclusions, understanding these arguments should serve as a positive stimulus to the development of better approaches. Fox is associated with the Centre for Environmental Studies, University of Tasmania, Hobart. (v7, #3)

Fox, Warwick. "The Deep Ecology-Ecofeminism Debate and Its Parallels." Environmental Ethics 11(1989):5-25. There has recently been considerable discussion of the relative merits of deep ecology and ecofeminism, primarily from an ecofeminist perspective. I argue that the essential ecofeminist charge against deep ecology is that deep ecology focuses on the issue of anthropocentrism (i.e., human-centeredness) rather than androcentrism (i.e., malecenteredness). I point out that this charge is not directed at deep ecology's positive or constructive task of encouraging an attitude of ecocentric egalitarianism, but rather at deep ecology's negative or critical task of dismantling anthropocentrism. I outline a number of problems that can attend not only the ecofeminist critique of deep ecology,--but also comparable critiques that proceed from a broad range of social and political perspectives. I then proceed to argue that deep ecology's concern with anthropocentrism is entirely defensible--and defensible in a way that should be seen as complementing and expanding the focus of radical social and political critiques rather than in terms of these approaches versus deep ecology. Fox is at the Centre for Environmental Studies, University of Tasmania, Hobart, Tasmania. (EE)

Fragomeni, Richard N. and John T. Pawlikowski, eds. The Ecological Challenge: Ethical, Liturgical, and

Spiritual Responses. Collegeville, MI: Liturgical Press, 1994. 140 pages, softbound. Thirteen contributors provide insights, coupled with practical suggestions, for an authentically religious response to the ecological crisis. Drawing upon the biblical, ethical, liturgical, and spiritual wisdom of the covenantal traditions of Judaism and Christianity, they emphasize what they think are frequently underemphasized aspects of their religious heritage. They also suggest areas that require new creative reflection that will push beyond traditional understandings. In several chapters they suggest ways in which ecological concerns might be concretely included which retain the integrity of the Church's liturgical and spiritual traditions. A sample: Thomas A. Nairn, "The Roman Catholic Social Tradition and the Question of Ecology." Nairn claims, "A contemporary ethic, using the signs of the times, would challenge Christians to move from a point of view in which nature has little or no value apart from human choices to one which sees humanity itself as part of the larger ecosystem" (p. 37). Fragomeni and Pawlikowski are both professors Catholic Theological Union, Albany, New York. (v6,#1)

Francis, John M., Review of Adams, W.M., Future Nature: A Vision for Conservation. Environmental Values 5(1996):369-371. (EV)

Francis, John M., "Nature Conservation and the Precautionary Principle," Environmental Values 5(1996):257-264. The application of the precautionary principle to an area of environmental protection, such as nature conservation, requires commitment to the idea that full scientific proof of a causal link between a potentially damaging operation and a long term environmental impact is not required. Adoption of the principle in Government statements related to sustainable development should therefore be seen in this context. The paper addresses the particular case of marine fish farming in Scotland where the principle was advocated but not upheld in practice. In the light of this experience there is a need for educators and philosophers, ethicists and concerned scientists to ensure that the principle is more widely

interpreted and understood. KEYWORDS: Nature conservation, sustainable development, international law, technology assessment. (EV)

Francis, Leslie Pickering. Review of Ethics and Problems of the 21st Century. Edited by K. E. Goodpaster and K. M. Sayre. Environmental Ethics 2(1980):373-78.

Francis, Leslie Pickering. "Global Systemic Problems and Interconnected Duties." Environmental Ethics 25(2003):115-128. Many problems in environmental ethics are what have been called "global systemic problems," problems in which what happens in one part of the world affects preservationist efforts elsewhere. Restoration of the Everglades is one such example. If global warming continues, the Everglades may well be flooded within the next quarter to half century and all restoration efforts will be for naught. Yet, the United States government is both pursuing restorationist efforts and withdrawing from the Kyoto Protocol on emissions of greenhouse gases. One aspect of global systemic problems concerns whether there are interconnections between the preservationist obligations of the locals and the duties of others. There are three main lines of arguments for concluding that there are, indeed, interconnected obligations in such cases. First, the consequentialist case for imposing duties on locals assumes that others do not have inconsistent consequentialist obligations. In addition, a related consequentialist case can be made that when problems are systemic, others have positive supportive duties. Second, a weak principle of reciprocity supports the interconnectedness of obligations. Insistence that someone has an obligation that benefits you implies the duty not to act to undermine the efforts of that person to fulfill that obligation. Third, a weak principle of fairness—that it is only fair to expect one person to bear the burdens of producing a collective good if others have obligations to do their cooperative part—supports interconnected obligations with regard to global systemic problems. Because all three arguments point to the same conclusion, there is a very strong case for interconnected obligations as part of the solution to global systemic problems—problems that are all too prevalent in our world today. Frank, Joshua, "A Constrained-Utility Alternative to Animal Rights," Environmental Values 11(2002):49-62. Numerous approaches have been taken in an effort to find a non-anthropocentric ethic that will lead to greater consideration of animals. Most of the recent approaches in this area have been rights-based. It is argued here that a rights-based approach alone fails both theoretically and in practical applications. It is shown that in theory these approaches can lead to unsound conclusions and cannot handle uncertainty. In addition, in practice the rules of the rights-based approaches will often be violated. A utility approach with unequal weighting for different species subject to certain rights or obligations is proposed as an alternative. This approach is intended to be operational rather than purely theoretical and therefore would be based on a negotiated consensus rather than a priori theory. (EV)

Franklin, Julian H. "Regan on the Lifeboat Problem: A Defense." Environmental Ethics 23(2001):189-201. Tom Regan has powerfully argued that all sentient beings having some awareness of self are equal in inherent value, and that their interests where relevant must be given equal treatment. Yet Regan also contends that there are some situations in which the value of different lives should be compared and choice made between them. He supposes an overloaded lifeboat with five occupants in which all will die unless one is thrown overboard. Four of the occupants are human, one is a dog; and Regan holds that it is the dog that ought to go since its life is of less value than that of a human. Regan has thus been sharply attacked for inconsistency. Some say that the comparison of lives, even in this sort of case, contradicts the principle of equal inherent value and introduces a utilitarian calculation of benefit. Others object that no ground of choice exists in situations of this sort. But all these criticisms turn out to be unjustified. (EE)

Franklin, Sarah, "Dolly: a New Form of Transgenic Breedwealth," Environmental Values 6(1997):427-437. ABSTRACT: Public debate in Britain surrounding the cloning of Dolly the sheep has primarily focused on the legitimacy of cloning humans, not sheep. This bracketing of the human question relies on a distinction between humans and animals belied by the very constitution of transgenic animals who are made with human DNA, such as Dolly. Moreover, the ways in which human beings think about, manipulate and classify animals have distinct cultural consequences, for example in relation to cultural understandings of life, property, kinship and other forms of social interconnection. This article introduces the term "breedwealth" to examine Dolly as a unique form of property in order to make some of these connections more visible. Franks, Nigel R. and Tom Richardson, "Teaching in Tandem-running Ants," Nature 439(12 January 2006):153. An ant can signal another ant leading from the nest to food, with signals between the two controlling both the speed and course of the run, called a tandem run. The tandem leaders know the location of food but the tandem followers are naive. The tandem leaders only continue the run when frequently tapped on their legs and abdomen by the following ant's antennae. The tandem leader, therefore, modifies its behavior in the presence of the follower.

"An individual is a teacher if it modifies its behaviour in the presence of a naive observer, at some initial cost to itself, in order to set an example so that the other individual can learn more quickly." Despite the "in order to" in this definition, these authors posit only behavior selected for its survival behavior, and no intent to teach, much less any theory of mind, or ideas passing from teacher to disciple. Compare also the recent claims for teaching in meerkats, who differentially maim prey when the young are learning to hunt. Thornton, Alex and Katherine McAuliffe, "Teaching in Wild Meerkats," Science 313(14 July 2006):227-229.

As with some extended definitions of "culture" (imitated behavior), we now find extended definitions of "teaching" (selection for alternative behaviors in the presence of the naive that facilitate their learning). The authors speculate that teaching does not require big brains, only that it be useful for survival. The authors are in biology, University of Bristol, UK.

Fraser, David, Phillips, P.A., and Thompson, B.K., "Environmental Preference Testing to Assess the Well-Being of Animals - An Evolving Paradigm", Journal of Agricultural and Environmental Ethics 6(1993). Supplement. Environmental preference testing (i.e. research in which animals are allowed to choose among two or more alternative environments or environmental features) is a useful but sometimes problematic approach to improving animal well-being. Preference testing paradigms are evolving rapidly, as evidenced by the number of different procedures being proposed and the volume of debate over their usefulness and validity. One significant shift has been the trend toward asking more precise questions about animal preferences, with more attention to the relevant variables. This has required more comprehensive response measures and more elaborate experimental designs. Results which deviate from the average need to be interpreted with care; these may involve genuine individual differences among animals, options that are preferred for specific minority activities, or they may indicate that important variables have been overlooked. Strategies have also emerged for using preference tests to indicate principles underlying the animals' preferences. Preference testing often needs to be followed by complementary experiments to test whether the animals react differently to preferred and unpreferred options when these are presented alone, or to test the animals' motivation for a preferred option. Tests of motivation are potentially of great value, but much more effort is needed to validate suitable methods. In some cases, animals prefer an environment which is not the most beneficial for health, survival and reproductive success in farm environments. In such cases, agriculturalists may well provide an unpreferred environment, but the animals' preferences still need to be understood so that any resulting distress can be minimized. Fraser, Phillips, and Thompson are at the Centre for Food and Animal Research, Agriculture Canada, Ottawa Canada K1A 0C6.

Fraser, I; Hone, P, "Agricultural land retirement: lessons from an Australian case study," Land Use Policy 20(no.1, 2003): 61-72.

Fraser, Vikki. "What's the Moral of the GM Food Story?" Journal of Agricultural and Environmental Ethics 14(2001):147-159. This paper is an attempt to examine issues and problems raised by agricultural biotechnology by drawing on the richness of contemporary ideas in ethical theory and thereby contribute to the project of establishing new approaches to these problems. The fundamental argument is that many of the negative aspects of agricultural biotechnology are generated at the level of the underlying conceptual frameworks that shape the technology's internal modes of organization, rather than the unintended effects of the application of an inherently benevolent set of techniques. If "food ethics" is to address the adverse impacts of agricultural biotechnology, it must ultimately challenge these conceptual frames, which, I argue, emerge from Enlightenment, liberal, political, and economic theory.

The translation of traditional bioethics (focusing on principles such as autonomy and rights, justice, and well being) into food ethics does not produce the critical tools that are able adequately to challenge the harmful legacy of Enlightenment thinking. What is needed are reorientations of ethics that are capable of formulating concepts and approaches that to some extent break with the presuppositions that underpin biotechnology at its foundation. This paper suggests that narrative and feminist critiques of medical bioethics are a good place to start in this project. Keywords: bioethics, biotechnology, food ethics, narrative ethics, principlism. Vikki Fraser is at the Centre for the Study of Ethics, Queensland University of Technology Carseldine Campus, Beams Road, Carseldine, Brisbane, Queensland Australia. (JAEE)

Frasz, Geoffrey, "Review of: Peter List, ed., Environmental Ethics and Forestry: A Reader," Conservation Biology 18(2004):586-587. (v. 15, # 3)

Frasz, Geoffrey, book review of Peter List (ed.), Environmental Ethics and Forestry: a Reader, Conservation Biology 18 (no. 2, 2004): 586-7.

Frasz, Geoffrey B., The Problem of Community. Ph.D. dissertation at the University of Georgia, completed 1994, under the direction of Frederick Ferré. The philosophical problem of community, reflected in the field of environmental ethics. Chapter 1: How to balance the needs, rights, and interests of the community as a whole with the needs, rights, and interests of the individuals who make up that community; how to develop a mixed community that allows for human flourishing, as well as a diverse nonhuman biotic component. This is applied to the holism/pluralism debate. Chapter 2: The human community, attempts to define community, and two major attempts to describe this. Chapter 3: The biotic community: a historical account of the change in ecology from populations to ecosystems, ending with a new version of a biotic community based on insights from the emerging science of complexity; a critique of the positions of Aristotle and Whitehead on community, and the metaphysical concepts of humans and nature that underlie each one. Chapter 4: Aristotle's concept of friendship can be extended through Whitehead to include nonhuman entities. Chapter 5: Whitehead's metaphysics can serve as a foundation for a postmodern concept of community; the general features of a constructive postmodern version of community; Frederick Ferré's "personalistic organicism" provides a solution to the community problem in environmental ethics. Frasz is currently teaching a course in environmental ethics at the Community College of Southern Nevada that attracts environmental science students from the University of Nevada at Las Vegas. Address: Geoffrey Frasz, Philosophical and Regional Studies, Community College of Southern Nevada, North Las Vegas, NV 89030, USA. 702-651-4126. <frasz@nevada.edu>

Frasz, Geoffrey, "What is Environmental Virtue Ethics that We Should Be Mindful of It?" Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001): 5-14. There has been increased interest in developing environmental virtue ethics (EVE). This paper presents some of the central features of this project. The first part is a general description of EVE, showing why there is a need for it. The second part spells out the central features of EVE including an account of the good life as flourishing in an expanded or mixed biotic community, and provides a tentative list of important environmental virtues. The third part examines one virtue: friendship, showing how an understanding of it provides insight into current issues in environmental ethics. The final section addresses a challenge to the project of EVE. Frasz is in the Philosophical and Regional Studies Department, Community College of Southern Nevada, Las Vegas. (v.13,#2)

Frasz, Geoffrey B. "Environmental Virtue Ethics: A New Direction for Environmental Ethics." Environmental Ethics 15(1993):259-74. In this essay, I first extend the insights of virtue ethics into environmental ethics and examine the possible dangers of this approach. Second, I analyze some qualities of character that an environmentally virtuous person must possess. Third, I evaluate "humility" as an environmental virtue, specifically, the position of Thomas E. Hill, Jr. I conclude that Hill's conception of "proper" humility can be more adequately explicated by associating it with another virtue, environmental "openness." Frasz is in the Department of Philosophic and Regional Studies, Community College of Southern Nevada, North Las Vegas, NV. (EE)

Frederick, Kenneth D. and Roger A. Sedjo, eds., America's Renewable Resources: Historical Trends and

Current Challenges. Washington, DC: Resources for the Future, 1991. 296 pages. Chapters on water, forests, rangeland, cropland, wildlife, outdoor recreation. With particular attention to sustainable development. A frequent theme is that private ownership of resources provides the best resource protection and management. Most of the authors are researchers on the staff of Resources for the Future (RFF), a non-profit organization working since 1952 to promote development, conservation, and use of natural resources. (v3,#4)

Frederick, Robert E., and W. Michael Hoffman, "Environmental Risk Problems and the Language of Ethics," Business Ethics Quarterly 5(1995):699-711. Six criteria for assessing proposed solutions to environmental risk problems. But before these criteria can be used business persons must be willing to discuss the problem in ethical terms, and they are often reluctant to do so.

Frederick, William C., "Anchoring Values in Nature: Toward a Theory of Business Value," Business Ethics Quarterly 2(1992):283-303. The dominant values of the business system--economizing and power-aggrandizing--are manifestations of natural evolutionary forces to which sociocultural meaning has been assigned. Economizing tends to slow life-negating entropic processes, while power-aggrandizement enhances them. Both economizing and power-aggrandizing work against a third (non-business) value cluster--ecologizing--which sustains community integrity. The contradictory tensions and conflicts generated among these three value clusters define the central normative issues posed by business operations. While both economizing and ecologizing are anti-entropic and therefore life-supporting, power augmentation, which negates the other two value clusters, is pro-entropic and therefore life-defeating. Business ethicists have tended to overlook the normative significance of nature-based value systems. Reconciling these is the most important theoretical task of business ethicists. A presidential address to the Society for Business Ethics, August 1991.

Frederick, William C., "Anchoring Values in Nature: Toward a Theory of Business Values," Business Ethics Quarterly 2(1992):283-303. The dominant values of the business system--economizing and power-aggrandizing--are manifestations of natural evolutionary forces. Economizing tends to slow the life-negating entropic processes, while power-aggrandizing enhances them. Both economics and power-aggrandizing work against a third (non-business) value cluster--ecologizing--which sustains community integrity. The contradictory tensions generated among these three value clusters define the central normative issues for business operations. Both economizing and ecologizing are negentropic and therefore life-supporting, but power augmentation, which negates the other two value clusters, is entropic and therefore life-defeating. Business ethicists have tended to overlook the normative significance of nature-based value systems. Reconciling economizing and ecologizing values is the most important theoretical task for business ethicists. Frederick is in the graduate school of business at the University of Pittsburgh. (v5,#2)

Frederick, William Crittenden, Values, Nature, and Culture in the American Corporation. New York: Oxford University Press, 1995. Chapter 6 is "Ecologizing Values and the Business Dilemma," with four ecologizing values: linkage, diversity, homeostatic succession, and community. Also "Anthropocentric Interpretations of Ecological Processes," "The Interface of Economizing and Ecologizing," "Varieties of Ecological Process," "Power Aggrandizement and Ecologizing," and "The Central Ecological Value Problem." An earlier version of this chapter is "Anchoring Values in Nature: Toward a Theory of Business Values," Business Ethics Quarterly, July 1992, pp. 283-303. "An economic system does not stand alone in grand isolation from the everyday life of ordinary people but is instead a pulsating human organism thoroughly embedded in societal and cultural [and ecological] life" (p. xiv). Other chapters are a penetrating insight into values (such as profits and desire for power), as these drive business. Frederick teaches ethics at the University of Pittsburgh. (v6,#4)

Frederiksen, Harald D., Review of Petri S. Juuti and Tapio S. Katko, eds., *Water, Time and European*

Cities, Environmental Values 16(2007):277-279.

Free Inquiry, Spring 1993, is a special issue, "Does Humanism Encourage Human Chauvinism?" with fourteen short articles, for example, Eugenie C. Scott, "Us and Them, Nature and Humanism"; James Lawler, "Ecocentric Ethics"; Frank Cullen and Ingrid Newkirk, "Humanism in a Biocentric Universe" Bernard Rollin, "Intrinsic Value for Nature--An Incoherent Basis for Environmental Concern." An example of anthropocentrism at its best, or worse, depending on your point of view, is Jan Narveson, "Humanism Is for Humans." "What the current ecological movement is about is the capacity to enjoy a North American/European lifestyle, and to do so into the indefinite future. What is unique about it is its claim that we can't do this for technological reasons. It isn't so." "There is, to repeat, no resource problem, no resource problem of consequence for the globe." "What's wrong with things being in pretty good shape for our fellow humans, with every prospect of their getting better still if we can keep our wits about us?" Narveson teaches philosophy at the University of Waterloo. The whole issue makes good short pieces for classroom discussion. (v5,#1)

Freeden, Michael, Review of Brian Doherty and Marius de Geus, eds., Democracy and Green Political Thought. Environmental Values 7(1998):251.

Freeden, Michael, Green Ideology: Concepts and Structures. OCEES Research Paper No. 4. Oxford: Oxford Centre for the Environment, Ethics and Society, Mansfield College, 1995. 31 pp. Ideologies are "decontesting" devices that "attempt to confer cultural and conventional legitimacy on particular, narrow understandings of each of the political concepts they employ." The core concepts of green discourse involve the human-nature relation, nature preservation and variants of holism, together with an emphasis on appropriate human lifestyles. The "indeterminacy" of green core concepts allows them to weave in and out of an unusually wide range of political traditions. There are conservative and liberal-individualist components in contemporary green political thought. The equation of protective interventionism with ecofascism should be rejected as trite. "What the scholar of ideologies can do is to delineate, however roughly, the semantic field within which debate takes place."

Freedman, William H., and Fu, Jacqueline C. "Environmental Issues Affecting Business Transactions in Taiwan." Natural Resources and Environment 10, no.4 (1996): 43. (v7, #3)

Freeman, Aaren S., and James E. Byers, "Divergent Induced Responses to an Invasive Predator in Main Mussel Populations," Science 313(11 August 2006):831-833. A native mussel quickly evolves the capacity to defend itself against a recently introduced invasive crab, by growing a thicker shell when the new crab is present. This makes it harder for the crab to open the mussel and eat it, and crabs eat something else. So native species are not as defenseless as previously thought to invasives. Mussels are more flexibly adaptive.

French, William C. "Against Biospherical Egalitarianism." Environmental Ethics 17(1995):39-57. Arne Naess and Paul Taylor are two of the most forceful proponents of the principle of species equality. Problematically, both, when adjudicating conflict of interest cases, resort to employing explicit or implicit species-ranking arguments. I examine how Lawrence Johnson's critical, species-ranking approach helpfully avoids the normative inconsistencies of "biospherical egalitarianism." Many assume species-ranking schemes are rooted in arrogant, ontological claims about human, primate, or mammalian superiority. Species-ranking, I believe, is best viewed as a justified articulation of moral priorities in response to individuals' or entities' relative ranges of vulnerability and need, rooted in their relative ranges of capacities and interests. French is in the theology department, Loyola University. (EE)

Freud, Sigmund, The Future of an Illusion. New York: W. W. Norton, 1961. p. Freud on nature and culture. "Nature ... destroys us--coldly, cruelly, relentlessly. ... It was precisely because of these dangers with which nature threatens us that we came together and created civilization. ... For the principal task of civilization, its actual raison d'être, is to defend us against nature.

We all know that in many ways civilization does this fairly well already, and clearly as time goes on it will do it much better. But no one is under the illusion that nature has already been vanquished; and few dare hope that she will ever be entirely subjected to man. There are the elements, which seem to mock at all human control: the earth, which quakes and is torn apart and buries all human life and its works; water, which deluges and draws everything in a turmoil; storms, which blow everything before them; there are diseases, which we have only recently recognised as attacks by other organisms; and finally there is the painful riddle of death, against which no medicine has yet been found, nor probably will be. With these forces nature rises up against us, majestic, cruel and inexorable, she brings to our mind once more our weakness and helplessness, which we thought to escape through the work of civilization" (p. 19). (v.10,#1)

Freudenberger, C. Dean, "Bridging the Gap: Sustainable Development More Fully Considered," CTNS (Center for Theology and the Natural Sciences) Bulletin 16 (no. 4, Fall 1996):14-21. In sustainable development, at global scales, we are addressing questions only recently entertained in the human imagination. We have no historical precedents to help us fathom the implications of our present crisis. We have to learn that we are interdependently related to the land and share with it a marvelous, mutually enhancing relationship. Injustice in any form ultimately erodes human communities and the ecosystems in which they are founded. Freudenberger teaches at Luther Seminary, St. Paul, MN. (v8,#1)

Freudenberger, C. Dean, Global Dust Bowl: Can We Stop the Destruction of the Land Before It's Too Late? (Minneapolis: Augsburg, 1990). Freudenberger claims that "agriculture is the responsibility of the entire society." He advocates more education regarding Earth ethics and regenerative "agroecology that preserves and enhances natural resources." Forests and grasslands, much more than being natural resources, are awesome relational environments that teach us creaturehood. Freudenberger is professor of international development, missions, and rural church at the Claremont School of Theology. He has written about agriculture in national and religious life for two decades. (v2,#1)

Freund, Judith Ann, Landscapes of Promise: An Examination of Students' Journals Written During a Cross-cultural Wilderness Experience (High School Students), 1997, University of St. Thomas, Saint Paul, Ed.D. thesis. 188 pages. An examination of nature journals written by ten American and ten Russian high school students during a cross-cultural exchange that provided experiences in selected national wilderness areas designated by the respective countries. The students participated in a backpacking excursion in the Lee Metcalf Wilderness Area of Montana in the summer of 1994, and a camping experience in the wilderness areas in the provincial region of Penza, Russia in the summer of 1995. Aesthetic 'peak' experiences; spiritual inspiration derived from experiences in nature; attitudes toward the preservation of wildlife; and environmental ethics. (v.10,#1)

Frewer, L. J., A. Kole, S. M. A. Van de Kroon and C. de Lauwere, "Consumer Attitudes Towards the Development of Animal-Friendly Husbandry Systems," Journal of Agricultural and Environmental Ethics 18(2005):345-367. Recent policy developments in livestock husbandry have suggested that, from the perspective of optimizing animal welfare, new animal husbandry systems should be developed that provide opportunities for animals to be raised in environments where they are permitted to engage in natural behavior. This research focuses on understanding consumer attitudes and preferences regarding such systems, to ensure that they are acceptable to consumers as well as producers, regulators, and scientists. Consumer perceptions of animal welfare and animal husbandry practices were evaluated using a quantitative consumer survey, which focused on two animal husbandry issues - farmed pigs and farmed fish. A transparent, enforceable, and traceable monitoring system for animal welfare friendly products is likely to be important for consumers. Keywords Animal welfare - fish farming - pig farming - consumer attitudes. The authors are in the Marketing and Consumer Behaviour Group, Social Sciences Department, University of Wageningen, Wageningen, The Netherlands. (JAEE)

Freyfogle, Eric T., "The Ethical Strands of Environmental Law," University of Illinois Law Review, 4, 1994. The morality that underlies the environmental movement, and the extent to which environmental statutes reflect this new moral order in environmental law. The U. S. Congress's acts and pronouncements do not form a coherent moral order, nor do they convey a vision of ecological well-being. In result, environmental lawmaking is approaching a crisis of vision and imagination, stumbling on knotty issues such as nonpoint-source water pollution and declining wildlife habitat. Principles that could guide environmental lawmaking oriented by more encompassing, more deep-rooted issues of ecosystem health. Freyfogle teaches law at the University of Illinois. (v6,#2)

Freyfogle, Eric T., "Regulatory Takings, Methodically," ELR (Environmental Law Reporter) News and Analysis 31, pp. 10313-10321. "One of the most important ongoing changes in property law is the redefinition of ownership norms to protect the healthy functioning of the natural systems on which all life depends. Rights to use land are coming to depend on the land's natural features, and definitions of harm are coming to include disruptions of natural components such as topsoil, hydrologic systems, and biological diversity. The proper role for takings law is not to throw a wrench in the works of these much needed changes but rather to help guide them so that they occur in ways that maintain the health of private property as an institution" (p. 10321). (v.13,#1)

Freyfogle, Eric T., "Owning the Land: Four Contemporary Narratives," Journal of Land Use and Environmental Law 13(no. 2, Spring 1998):279-307. 1. The Libertarian ideal of autonomy. 2. The traditional understanding focused on economic opportunity. 3. A community-centered narrative that understands property as an evolving tool to meet community needs. 4. A biocentric narrative that looks to the land itself to prescribe the rules on how it can be used. A memorable expression of the last is Just v. Marinette County, a wetlands decision. The Court said: "An owner of land has no absolute and unlimited right to change the essential natural character of his land so as to use it for a purpose for which it was unsuited in its natural state and which injures the rights of others" (cited, p. 320). (v.10,#3)

Freyfogle, Eric T., "Ethics, Community, and Private Land." Ecology Law Quarterly 23(1996):631-661. Aldo Leopold advocated a land ethic. "Leopold was no lawyer and he gave little thought to how his land ethic, or any ecological informed land ethic, might fit together with the legal elements of private property rights. But as versions of his ethic have gained support, the issues has inevitably arisen. Is it possible, consistent with existing landed property rights, to push landowners to use their land more ethically? Is it possible to take the institution of private property, which has to do with private rights and economic

freedoms, and somehow combine it with an ecologically sound land ethic? Implicit in all of this speculation is the assumption that private property and land ethics are different animals, and not all that closely related. One has to do with private rights, the other with public responsibilities. One deals with legal entitlements, the other with moral suasion. ... Is it right to assume, as a point of beginning, such a wide divergence between property and land ethics? Perhaps they are more alike than we realize. Perhaps a certain kinship between them is hidden somewhere in the continuing reality of the community and in the still-lively value that we attach to community well-being--a kinship that, once understood might help us to find our way toward a private property regime that is ecologically, as well as economically sound." Freyfogle is professor of law at the University of Illinois, and one of the most philosophically literate of those writing in environmental law. (v7,#4)

Freyfogle, Eric T., "Boundless People, Boundless Land," pages 15-37, in Knight, Richard L., and Peter B. Landres, Stewardship Across Boundaries (Washington, DC: Island Press, 1998). "We see some of the character traits and tendencies that justify our continued use of certain boundaries: our ability to know and love only a human-size piece of land; our need to feel attached to the land and hence connected to our labor; our ingrained love of territory and our firm attachment to private property; our need to feel a part of a community; our desire for engagement with others in dignified ways. . . . Beyond these limits, though are other limits that now constrain us, and may of these limits we would do well to unbind and discard. Our love of individualism and love of liberty have simply become too strong, so much that they constrain our ability even to talk seriously about the common good. We are similarly hampered by our infatuation with the free market, with market-set valuations of things, and with the market's tendency to view nature as merely a collection of discrete resources. Intellectual limits like these have prompted us to bound the land needlessly and to make our boundaries more important than they ought to be. We somehow have to get away from them" (pp. 34-45). Freyfogle is in law at the University of Illinois. He has a book under this title forthcoming. (v.9,#3)

Freyfogle, Eric T., "The Construction of Ownership," University of Illinois Law Review, vol. 1996, no. 1, pages 173-187. Modern culture increasingly relies on patchwork remedies for societal problems. Freyfogle calls instead for a fundamental change in land-ownership jurisprudence. Current property law does little to discourage a landowner from acting in self-serving ways to accommodate immediate needs--a shortcoming that necessarily sacrifices the land's long-term health. We need to readjust our vision of our country's land-ownership norms to help nourish the land's health and reinvigorate our faded senses of local community. Freyfogle teaches law at the University of Illinois. (v7,#2)

Freyfogle, Eric T., "Land Ownership, Private and Wild," Wild Earth 5, no. 4 (Winter 1995): 71- . (v6,#4)

Freyfogle, Eric T., "The Price of a Sustainable Environment," Dissent, Spring 1998, 37-43. "In the end, market-based tools [for environmental conservation] must fit into a larger scheme of environmental policy that has as its principal aim not the promotion of markets, but the achievement and maintenance of a healthy land. Out of our deliberations on environmental goals should come new understandings of what it means to be a good citizen. Owning land must come to entail belonging to a natural community with obligations to respect the integrity and fertility of that community. Rights to use water must be understood as a form of stewardship, constrained by duties to use water in beneficial ways. The possession of a pollution permit does not mean that pollution is a good activity; such permits, however useful and legally protected, must never give rise to anything like a right to pollute" (p. 43). Freyfogle is in law at the University of Illinois. (v.9,#3)

Freyfogle, Eric T., "The Owning and Taking of Sensitive Lands," UCLA Law Review (University of California at Los Angeles) 43(1995):77-138. The institution of private land ownership is primarily a regime of private power--direct power over the land itself and indirect power over the people and other

life forms whose health and fates are linked to the land. In landed property schemes, boundary lines are drawn on the Earth and some owner acquires rights to control the encompassed space. When the law respects private rights in land, it supports and defends this private power, standing ready to sustain it when appropriate by the use of public force.

Private ownership sinks deep roots into the culture of the United States, in part because the nation has long defined itself in contrast with places where private ownership did not thrive. In the late twentieth century, no force has shaken private ownership more profoundly than the environmental movement and its parent science, ecology. What ecology tells us is that all forms of life are linked with, and dependent upon, all other forms of life, and ultimately with the land itself. Nature's order is more than just a jumbled collection of discrete objects, each understandable in isolation. It is a maze of interconnection and interdependence, an organic whole laced together by nutrients and energy flowing through primary producers up to the top carnivores, and then back to the soil to nourish new life.

Inevitably and appropriately the new wisdom of ecology is altering old ways of imagining the land and relating to it. Change, however, has not arrived easily, particularly in the case of private property law, which is one of the more important ways that a culture expresses its ties to the nonhuman natural world. The bumpiest transition has come in the case of ecologically sensitive lands, lands that have special value in sustaining the healthy functioning of larger biotic communities--wetlands, barrier islands, riparian corridors, endangered wildlife habitats, and the like. Before the age of ecology, owners of sensitive lands enjoyed the same rights as other owners, including the right to transform a land parcel extensively, radically altering its ecosystem role. Today, these owners are under siege. Left along, sensitive lands fulfill their ecosystem functions; altered for intensive human use, the disruptive ripples spread widely, if at times slowly and invisibly. Now that we understand the roles of these lands, what should it mean for a private person to own them? Excellent article, a must read for those following the debate in this area. Freyfogle teaches law at the University of Illinois. (v6,#4)

Freyfogle, Eric T., "Five Paths of Environmental Scholarship," University of Illinois Law Review, Volume 2000, no. 1, pp. 115-134. 1. Libertarians. 2. Simple Fixers. 3. Dispute Resolvers. 4. Progressive Reformers. 5. Advocates for the Land Community. Differences among them deal chiefly with underlying issues that are rarely joined and perhaps never well considered. Failure to address these issues more openly weakens the scholarly field as a whole, making it less useful in particular for nonlaw readers. Includes some speculations on student law journal article selection processes and their impacts on environmental law as an academic field. Freyfogle is professor of law, University of Illinois College of Law. (v.11,#3)

Freyfogle, Eric T., and Newton, Julianne Lutz, "Putting Science in its Place," Conservation Biology 16(no. 4, August 2002):863-873. A process-based approach, distinguishing between issues of substance and issues of process, will help clarify and isolate the various proper roles of science in the overall land management equation. This also clarifies when nature can be said to possess intrinsic value, why it is proper for conservation biologists to base their work on normative goals, and why arguments about ecosystem management are sometimes less fruitful than they ought to be. On balance a goal not overtly tied to science, such as land health, offers the best option for land management. Freyfogle is at the University of Illinois College of Law, Newton is in natural resources and environmental sciences, University of Illinois, Urbana. (v.13, #3)

Freyfogle, Eric T., "Illinois Life: An Environmental Testament," University of Illinois Law Review, volume 1997, number 4, pages 1081-1108. "The environmental movement in Illinois, now decades old, brings together diverse citizens from all around the state and varied walks of life. Some live amid urban skyscrapers; others in sparsely populated rural townships. What motivates them to act, individually and through groups, is a felt concern for the health of the Illinois landscape and all that dwells on it, including humans. The thinking of these citizens ranges widely, both in terms of how they comprehend environmental problems and what they believe ought to be done about them. Despite this variety,

particular values and hopes emerge over and over, in the daily talk of individual environmentalists, in the position papers of environmental groups, and in the growing literature of environmentalism" (pp. 1081-1082). Freyfogle is in law at the University of Illinois. (v.9,#3)

Freyfogle, Eric T., "Ownership and Ecology," Case Western Reserve (University) Law Review 43(1993):1269-1297. Private land ownership, the laws and institutions, and what this tells us about the relationship between people and the Earth. How much ecological wisdom and how much foolishness lies embedded within these basic ownership ideas. The law's basic messages about ownership and the human-land tie are misguided. The flaws emerge more plainly as we learn more about ecology and gain greater ability to sense how we are damaging the Earth. A major cause of the environmental crisis and a major impediment to change lies in our legal culture, our inherited sense of owning the land. The Supreme Court said, a century ago, "All property in this country is held under the implied obligation that the owner's use of it shall not be injurious to the community." "By now," adds Freyfogle, "We should know that the community of which we are a part includes the soils, the waters, plants, and animals that live with us on Earth" (p. 1296-7). Freyfogle teaches in the University of Illinois College of Law. (v5,#1)

Freyfogle, Eric T., "The Particulars of Owning," Ecology Law Quarterly 25 (no. 4, 1999);574-590. The U. S. Constitution expressly protects private property. But property rights themselves largely arise elsewhere, from independent sources, and only then gain protection from the Constitution's text. I. Property and the popular will. II. Levels of community. III. Private property and public policy. IV. Coda: Valuing the particulars. A new trend is to tailor property rights to the land, often misinterpreted as an attack on property rights, but in fact protecting the core values of property, which depend in part on land itself. Freyfogle teaches law at the University of Illinois. (v.10,#3)

Freyfogle, Eric T. *Why Conservation Is Failing and How It Can Regain Ground*. New Haven: Yale University Press, 2006. The real meaning of good land use and six key tasks that those who care about healthy land must address. Freyfogle is in law, University of Illinois.

"Our libraries of data are more vast, but Leopold's peculiar talent lay less in his detailed knowledge than in his unmatched ability to integrate, to bring together, to nourish and heal, to imagine that long-term path toward fusion. As a people skilled in the opposite, in tearing down, fragmenting, discarding, degrading, and criticizing, we need Leopold as much as ever" (p. 10067). (v.11,#3)

Freyfogle, Eric T., "Community and the Market in Modern American Law," Pages 382-414 in Richards, John F., ed., Land, Property, and the Environment. Oakland, CA: ICS (Institute for Contemporary Studies) Press, 2002. Over the past century, U.S. laws and regulations have increasingly embedded property rights in a communal order, aimed in important part at protecting the natural environment. Aggregate calculations are hard to undertake, yet plentiful evidence suggests that these constraints have served not to contain economic growth but to help fuel it, by correcting the market's flaws in pricing and allocation and by fostering the kind of trust, social cohesiveness, and civic stability that any market needs to work well. In the ongoing drama of private property in America, the market is only one of the lead characters. Freyfogle is in law, University of Illinois at Urbana-Champaign. (v.13,#1)

Freyfogle, Eric T., "Local Value," Terra Nova 1(no. 2, 1996):29-39. Parcel of land are small pieces in a potent, market-based economy that has come to define the modern age, a system that operates on cash and values all things in terms of their cash equivalencies. Land is considered a commodity, and must look

appealing to people who have cash to spend. In this competition local lands have not fared well. Only nature continues to embrace these lots and to sense their worth, with lush weeds and sprouting trees covering more or less every unpaved spot. Living responsibly in a place means gaining an awareness of the local natural setting and trying to use that setting as a guide for the types of activities that are suitable for the land. It means mimicking nature, whenever possible, in deference to the more lasting wisdom that lies embedded within the land. Land is being mined by rich people who live elsewhere; while in fact the local people and these lands possess much intrinsic value. Freyfogle teaches law at the University of Illinois. (v7,#2)

Freyfogle, Eric T., "Land Ownership: Private and Wild," Wild Earth, Winter 1995/96, vol. 5, no. 4, pages 71-77. The word property shares etymological roots with such words as proper, appropriate, and propriety. Thus, embedded in the world, if not in today's version of the institution, are certain seemingly inescapable ideas--of rightful scale and proportion, of balance and order, of personal responsibility. To make something one's own--to transform it into one's property--is to make it part of one's life, an extension of one's person and character; it is to bring the thing within the fold of one's individual care and duty. Do these ethical ideas, we might wonder, lurk somewhere beneath the surface of American property law? Freyfogle teaches law at the University of Illinois.

Freyfogle, Eric T., Justice and the Earth: Images for our Planetary Survival. New York: Free Press, 1993. We all carry mental images of the natural world that help guide us in our daily interactions with the planet. Freyfogle shows how influential these guiding images are, and why we need to rethink them if we are to reverse the Earth's decline. We must reconsider familiar assumptions about owning property, about human superiority over other species, about the values of the free market, and the extent of our environmental knowledge. With examples from environmental controversies in Cape May, New Jersey, Ely, Minnesota, and on Utah's Burr Trail. How to replace outmoded, simplistic images with new images. Freyfogle is a professor of law at the University of Illinois and a naturalist. (v4,#3)

Ownership and the Common Good. 3. Clarifying the Common Good. 4. Re-defining Land-Use Harm. 5. Tailoring Rights to the Land. 6. Sharing the Benefits of Development. 7. The Taking of Property. 8. Rhetoric Counts. (v.11,#3)

Freyfogle, Eric T., "Consumption and the Practice of Land Health," pages 181-201, in Westra, Laura, and Werhane, Patricia H., eds., The Business of Consumption: Environmental Ethics and the Global Economy (Lanham, MD: Rowman and Littlefield, 1998). A sound ethic of consumption needs to build upon an ethical consideration toward the land and its health. Land health encompasses, however vaguely, the kind of durable, flourishing, self-recreating communal life that is the mark of a lasting link between people and place. Land health is not an easy matter to come to grips with, particularly when land is understood as the entire ecological community in a place, including the human members. Nevertheless, land health is a foundational limit on consumption. Freyfogle is in law at the University of Illinois.

Freyfogle, Eric T., "The Dilemma of Wendell Berry," University of Illinois Law Review 1994, no. 2:363-385. Because all unsustainable actions must, by definition, cease one day, it is far better that we change those actions now, by conscious choice, while we are still able to carve out productive and satisfying lives. The first step is for each of us to turn inward and make those changes in our own lives that will enable us to live lightly on the land. Only so can we promote the lasting health of the natural and social communities of which we are inextricably a part. In this vision, Wendell Berry is a twentieth century prophet, who, as perceptively and energetically as anyone, has borne witness to the profound moral challenges of the environmental age. Freyfogle is professor of law, University of Illinois, and the author of Justice and the Earth. (v5,#4)

Freyfogle, Eric T., Bounded People, Boundless Lands: Envisioning a New Land Ethic. Washington, DC: Island Press, 1998. 207 pages. A philosophical examination of personal responsibility and the dominion of humans beings over Earth. Private property rights, responsible land ownership, the rights of wildlife, ecological health, presented in the context of contemporary events and legal cases. "On the eve of the new century, Americans are much in need of a more poetic sense of the land, a sense of its organic wholeness and beauty; its inner motion and energy, its subtle music and spirituality. To tend the land wisely is not just to use it efficiently; it is to recognize the land's sacredness and show it due respect.

When the land is rigidly divided, physically and in the hearts of people, it becomes harder for people to experience the sense of boundlessness Aldo Leopold felt ... before human-created boundaries reasserted their potent influence. ... A sense of boundlessness needs to undergird a new land ethic. ... The time must come when landowners concern themselves not just with a single parcel of land but with the landscape that includes it" (pp. 173-174). Freyfogle teaches law at the University of Illinois, Urbana-Champaign. (v.10,#1)

Freyfogle, Eric T., "The Land Ethic and Pilgrim Leopold," University of Colorado Law Review 61(1990):217-256. An examination of whether and how far the Leopold land ethic can be incorporated into natural resource law. Freyfogle is professor of law, University of Illinois. (v1,#3)

Freyfogle, Eric T., "Owning the Wolf: Green Politics: Property Rights, Ecology Rights," Dissent, Fall 1994, pp. 481-487. The ranchers who object to the wolf's return own the land the wolf wants to roam. If private property means anything so one argument goes it means the right to halt trespass by animals with two legs or four. Private property claims have become a rallying cry for anti-environmentalism, and these claims deserve a fair examination. What does it mean for a person to own land that is an integral part of an ecosystem of which humans are a part? Has there been a "takings" when the landowner is required to maintain these ecosystemic processes? Human institutions need reshaping in recognition of the functioning biotic communities where people live. Among the institutions that will require change, the institution of private property stands high on the list. Thoughtful, brief article, eminently suited for raising these issues with students. Freyfogle is professor of law, University of Illinois. (v5,#4)

Freyfogle, Eric T. "Water Rights and the Common Wealth." Environmental Law 26, no.1 (1996): 27. Freyfogle takes issue with the view that water marketing should be the primary tool to meet new needs for water in the West and to bring an end to the most environmentally damaging water uses. Recognizing that market reasoning only perpetuates the view that nature is merely a collection of resources, existing chiefly to serve human needs and easily shifted from place to place, Freyfogle encourages lawmakers to react by making the beneficial-use requirement a more meaningful construct. Friederici, Peter, "Return of the Jaguar," National Wildlife 36, no. 4, June/July 1998, pp. 48-51. Jaguars are back in the United States. Jaguars were once present in southern Arizona and New Mexico,

occasionally found throughout the U.S. Southwest, but were shot out and have been gone about half a century. But now they are returning, on their own, moving north from Mexico. Environmentalists, including some ranchers, welcome them, but not everyone is rolling out the welcome mat. The jaguar is not on the U.S. Endangered Species list, because it was judged extinct in the U.S. (v9,#2)

Friedland, David M., Hagerty, Timothy J. "NMA, CMA, and 'Federal Enforceability' Under the Clean Air Act." Journal of Environmental Law and Practice 3(no.4, Jan. 1996):59. Controls need not be "federally enforceable" to be considered in calculating "potential to emit" for status as a major source under the Clean Air Act. (v7,#1)

Friedland, Jonathan, "Green Chile: Across Latin America, New Environmentalists Extend Their Reach," The Wall Street Journal (3/26/97): A1. Environmentalism gains ground in Chile. As evidenced by a hit television series that takes as its theme the conflict between Chile's economic growth (the highest in Latin America) and protection of its "once-bountiful natural resources," Chile has South America's strongest and most broad-based environmental movement. "The ideology that growth will solve all our problems just isn't credible anymore; there has been too much damage to the environment and human welfare." For example, during the winter, the smog in Santiago (the capital) is so bad that hundreds of school children are hospitalized with respiratory ailments. There are 150 grass-roots environmental groups in Chile. "Billions of dollars in new investments, involving major foreign companies, are now hung up by administrative, legal and even physical challenges mounted by local citizens groups, environmental groups or a combination of the two." Conama, the country's environmental protection agency, was established in 1989 but hasn't had real regulatory authority until recently. Chile's president Eduardo Frei says that Conama won't approve projects that fail to meet the country's new environmental standards (ones he claims are the most rigorous in Latin America), but once a project is approved by Conama, he says "he won't permit people to halt development for environmental reasons." Conama's executive director says the agency tries to strike a balance, but "the absolute first priority of this country is achieving a growth rate which allows us to bring low-income groups out of poverty" (thus embracing the assumption that economic growth will solve the poverty problem). There are currently about 40 lawsuits against the agency, many relying on a clause in the Chilean constitution guaranteeing every citizen a right to a clean environment. The reporter of this article defines deep ecology as a view "which calls for preservation at all costs." (v8,#1)

Friedman, Thomas L., The Lexus and the Olive Tree: Understanding Globalization. New York: Farrar, Straus, and Giroux, 1999. 394 pages. Popular book by a leading free market apologist. "Because globalization as a culturally homogenizing and environment-devouring force is coming on so fast, there is a real danger that in just a few decades it could wipe out the ecological and cultural diversity that took millions of years of human and biological evolution to produce." But then globalization would itself be

unsustainable, lacking an ecological base. Friedman hopes that market principles can save environmental diversity, that the global network will be used to organize environmental defense, and that technology will reduce the volume of materials needed for the economy and engineer new genetic forms. Also, unless population growth slows, it will be impossible to protect the environment. Friedman is foreign affairs columnist for the NY Times. (v.11,#1)

Friedmann, John and Haripriya Rangan, eds. In Defense of Livelihood: Comparative Studies on Environmental Action. Kumarian Press, 1993. 220 pages, \$21.95. The product of a research program at the United Nations Research Institute for Social Development, this book presents case studies of struggles and innovative practices of local groups in seven regions of the developing world. The researchers asked the question: What happens when people unite to defend the land and natural resources that are the immediate sources of their livelihood?

Friend, Anthony M., "Economics, Ecology and Sustainable Development: Are They Compatible?" Environmental Values Vol.2 No.2(1992):157-170. "Quand un economiste vous repond on ne comprend plus ce qu'on lui avait demande." Andre Gide, Journal. ABSTRACT: The prevailing economic paradigm, in which a closed circular flow of production and consumption can be described in terms of 'natural laws' of the equilibrium of market forces, is being challenged by our growing knowledge of complex systems, particularly ecosystems. It is increasingly apparent that neo-classical economics does not reflect social, economic and environmental realities in a world of limited resources. The best way to understand the problems implicit in the concept of 'sustainable development' is provided by Ecological Economics--a new synthesis in which the traditional virtue of thrift is justified using modern ideas from systems theory and thermodynamics. KEYWORDS: Ecological economics, entropy, natural resources, sustainable development, thrift. Institute for Research on Environment and Economy, University of Ottawa, Institut de Recherche sur l'Environnement et l'Economie, Universite d'Ottawa, 5 Calixa Lavalee, Ottawa, Ontario, Canada K1N 6N5.

Friend, Tim, "A Wartime First: Dolphins Called to Clear Mines," USA Today, March 27, 2003. Dolphins in Iraqi war. For the first time, the U.S. Navy has deployed an undisclosed number of bottlenose dolphins to recognize mines using their echolocating solar and to mark the locations of the mines with special buoys. Dolphins have been previously used for "swimmer defense," to search for scuba divers who might have been trying to attach explosives on U.S. Navy vessels. The U.S. Navy also works with sea lions who have been taught to attach leg restraints to human interlopers they detect.

Frierson, Patrick. "Metastandards in the Ethics of Adam Smith and Aldo Leopold." Environmental Ethics 29(2007):171-191. Adam Smith is not an environmentalist, but he articulated an ethical theory that is increasingly recognized as a fruitful source of environmental ethics. In the context of this theory, Smith illustrates in a particularly valuable way the role that anthropocentric, utilitarian metastandards can play in defending nonanthropocentric, nonutilitarian ethical standpoints. There are four roles that an anthropocentric metastandard can play in defending an ecocentric ethical standpoint such as Aldo Leopold's land ethic. First, this metastandard helps reconcile ecocentrism with theodicy, either of the religious sort - showing that God is good - or of the evolutionary sort - showing that ecocentrism is consistent with human ethical dispositions as evolved through a process of natural selection. Second, using anthropocentrism as a metastandard helps reconcile our moral interest in human welfare with a thoroughly ecocentric standpoint. Third, defending ecocentrism by appeal to an anthropocentric

metastandard provides a way of swaying die-hard anthropocentrists to adopt a more ecocentric perspective without showing disrespect to nature in the process. Finally, the systematic quasi-ecological connection between ecocentrism as an ethical standard and anthropocentrism as a metastandard has a beauty of its own that can provide additional motive to adhere to ecocentric ethical norms. Friesen, L., "Targeting Enforcement To Improve Compliance With Environmental Regulations," Journal of Environmental Economics and Management 46(no. 1, 2003): 72-85. (v 14, #3)

Friskics, Scott, "Context Matters: Remarks on Environmental Education," International Society of Environmental Ethics Newsletter, vol. 13, no. 1 (Spring 2002), pp. 4-7. "For me, context is everything. It grounds my thinking and writing. I can't imagine talking about environmental ethics without making some reference to Montana's Rocky Mountain Front, Bob Marshall Wilderness Complex, Zortman-Landusky mine site, or other defining features of the place I inhabit. In order to speak, I have to be speaking from somewhere. The same goes for ethical action. For me, ethics is a matter of responsibility - being responsive to the call, the touch, the face of the other, regardless of whether it's the call of a meadowlark, the touch of a lover, or the face of a mountain. Ethical action seems rooted in these kinds of encounters - these dialogues with the others whom we meet and to whom we must respond.

Context is everything in teaching, too. I teach environmental ethics at Fort Belknap College, a tribally controlled community college located on the Fort Belknap Indian Reservation, home of the Gros Ventre (White Clay/Ah-Ah-Ne-Nin) and Assiniboine (Nakoda) Tribes. Ninety-five percent of the students in my class are American Indians - mostly Plains Indians. ... So, how does one go about teaching environmental ethics in this context?

Friskics teaches environmental ethics and works as a grant-writer at Fort Belknap College (P.O. Box 159; Harlem, MT, 59526). (v.13,#1)

Friskics, Scott, "How Does Nature Speak to Our Concern? The Case of Montana's Rocky Mountain Front" Pages 193-207 in Kaplan, Laura Duhan, Philosophy and Everyday Life (New York: Seven Bridges Press, 2001). People who love "the Front" (a rise of mountains at the edge of the plains) "speak of contact and encounter--either for the first time, over the course of a lifetime, or even across generations. They speak of a certain way of knowing this particular place, a knowledge that, despite an uncanny, ineffable quality, conveys an indwelling sense of beauty, specialness, sacredness, and wildness" (p. 199).

Alas, however, the oil and gas industry desires the Front, including some now protected areas. In a continuing controversy, the supervisor of the U.S. Forest Service Lewis and Clark Forest (Gloria Flora) made, commendably and surprisingly, a final decision to protect the Front from oil and gas leasing for at least 10-15 years. Her summary cites the strong sense of place felt by so many who testified at the hearings. Friskics concludes: "With a knowledge and certainty born of sustained contact with the being and things of the Rocky Mountain Front, I know that these mountains ought not--no, must not, be opened up to oil and gas (or mineral) development. Out of respect and love for the Front, we--I--must remain vigilant and active" (p. 206). Friskics teaches environmental ethics and works as a grant-writer at Fort Belknap College (P.O. Box 159; Harlem, MT, 59526). (v.13,#1)

Friskics, Scott, "Dialogue, responsibility, and oil and gas leasing on Montana's Rocky Mountain Front," Ethics and the Environment 8(no. 2, 2003):8-30. The aesthetic and emotive power of the Rocky Mountain Front in Montana, challenged by the oil and gas industry. "With a knowledge and certainty born of sustained contact with the beings and things of the Rocky Mountain Front, I know that these mountains ought not--no, must not--be opened up to oil and gas (or mineral) development." Friskics is at Fort Belknap College, a tribally controlled community college located on the Fort Belknap Indian Reservation in Montana. (E&E)

Friskics, Scott. "Dialogical Relations with Nature." Environmental Ethics 23(2001):391-410. I suggest

that our dialogical encounters with our fellow creatures furnish the experiential ground of ethical action with respect to them. Unfortunately, this ground is seldom realized or recognized in our society; our capacity for ethical action remains unmoored from its animating sources. Yet despite our habitual inattentiveness, nature's creatures may still grace us with their presence in dialogue. The works of Martin Buber and Henry Bugbee provide the theoretical framework within which I attempt to work through these ideas and interpret their ethical significance in the context of personal experience. (EE)

Friskics, Scott. "The Twofold Myth of Pristine Wilderness: Misreading the Wilderness Act in Terms of Purity." *Environmental Ethics* 30(2008):381-399. In recent years, the notion of wilderness has been roundly criticized by several prominent environmental philosophers and historians. They argue that the "received wilderness idea" is dualistic, ethnocentric, and static. According to these critics, this idea of wilderness finds clear expression in the Wilderness Act of 1964. However, the idea of wilderness so ably deconstructed by its critics bears little resemblance to the understanding of wilderness presented in the Wilderness Act. The critics assume a backward-looking, purity-based definition of wilderness that runs counter to the forward-looking, relativistic interpretation of the Wilderness Act that has guided and informed subsequent wilderness legislation, management, and visitation. Under the Wilderness Act, wilderness designation is less a matter of preserving remnants of "pristine" nature than establishing a covenant between humans and a particular place. Wilderness areas, so conceived, serve as potential sabbath places, whose ultimate significance is best understood in terms of their mutually informing relationship to the places where we live and work. Rather than detracting from our efforts to inhabit the Earth in more creative and sustainable ways, wilderness represents a vital part of larger landscapes of human inhabitation characterized by a diverse mixture of human-nature relational patterns. Frodeman, Robert. "Radical Environmentalism and the Political Roots of Postmodernism." Environmental Ethics 14(1992):307-19. I examine the close relationship between radical environmentalism and postmodernism. I argue that there is an incoherence within most postmodernist thought, born of an unwillingness or incapacity to distinguish between claims true from an ontological or epistemological perspective and those appropriate to the exigencies of political life. The failure to distinguish which differences make a difference not only vitiates postmodernist thought, but also runs up against some of the fundamental assumptions of radical environmentalism. Frodeman is in the department of philosophy, Fort Lewis College, Durango, CO. (EE)

Frodeman, Robert. "The Policy Turn in Environmental Philosophy." Environmental Ethics 28(2006):3-20. A policy turn in environmental philosophy means a shift from philosophers writing philosophy essays for other philosophers to doing interdisciplinary research and working on projects with public agencies, policy makers, and the private sector. Despite some steps in this direction, a policy turn remains largely unrealized within the community of environmental philosophers. Completing this shift can contribute to better decision making, help discover new areas for philosophic investigation at the intersection of philosophy and policy, and identify new employment prospects for philosophy graduates. Fudge, Robert S., "Imagination and the Science-Based Aesthetic Appreciation of Unscenic Nature," Journal of Aesthetics and Art Criticism 59(no. 3, Summer 2001):275-285. "A number of twentieth-century philosophers have suggested ways to develop an aesthetic appreciation of unscenic nature (including Holmes Rolston and Allen Carlson). ... Our appreciation should be science-based; science can reveal to us heretofore overlooked properties of natural objects, providing new opportunities for aesthetic experience. Recently, however, Emily Brady has argued against this approach, claiming instead that our appreciation should arise out of imaginative activity. In what follows, I argue that these two approaches are not only not mutually exclusive, but that the imagination is most effective in helping us develop an aesthetic appreciation of unscenic nature, precisely when it employs, and is guided by, scientific knowledge. Fudge is in philosophy, James Madison University, Harrisonburg, VA. (v.13,#1)

Furze, Brian, "The World Agricultural System and Ethical Considerations Relating to the Rural Environment: Some Perspectives on Cause and Effect in Underdeveloped Countries", Journal of Agricultural Ethics 2(1989):59-67. Using the concept of capitalist world economy as a framework, this paper provides a structural analysis of the food production and distribution system within monopoly capitalism and its implications for countries of the underdeveloped world. Focusing on the impact of a dominant world food supply system on indigenous systems, considerations relating to environmental use and food production and distribution are raised. A call is made for a new agricultural ethic. Furze is in social science education at the University of New England, Australia.

Furze, Brian. "Ecologically Sustainable Rural Development and the Difficulty of Social Change." Environmental Values Vol.2 No.2(1992):141-156. ABSTRACT: This article explores the importance of environmental perception in the context of alternative agrarian social relations. Because environmental perception is socially constructed, the article is concerned with how those with an alternative agenda for agrarian practice attempt change, and the likely difficulties faced due to the structural requirements and effects of the dominant paradigm of development. It explores the need for a clear model of change, both in its outcomes and its change strategies, and the difficulties that may be faced. The article draws on a case study of a rural landsharing collective in Australia to contextualize these broader issues, and considers some of the implications of the findings for instigating the broader concern of an ecologically sustainable agrarian practice based on permacultural design. KEYWORDS: Permaculture, rural land sharers, sustainable agriculture, sustainable rural development. Dept. of Social Science, University of New England, Armidale, NSW 2351 Australia.

Gaard, Greta "Women, Water, Energy: An Ecofeminist Approach", Organization and Environment 14 (No. 2, June 2001) pp.157-72. Using contemporary examples ranging from the Arrowhead-Weston Project to Manitoba Hydro, Suma Energy 2, and the Columbia River dams, this article exposes the corporate appropriations of water power from the people and the land. Ecofeminism illuminates the way in which gendered , cultural assumptions about water, power and human relations have led to creating a water-power infrastructure that perpetuates environmental sexism, environmental racism, and environmental classism. As an alternative, an ecofeminist approach to water justice advocates strategies for bringing about an ecological democracy, an ecological economics, and a partnership culture in which water and energy flow freely. Gaard is associate professor of philosophy at Fairhaven College, Western Washington University. (v.13,#2)

Gaard, Greta, Ecological Politics: Ecofeminists and the Greens. Philadelphia: Temple University Press, 1998. An account of these two interconnected social movements from their grassroots origins in the 1970's to the 1996 presidential campaign. There is often a transition from a leftist and sometimes anarchist focus to an emphasis on electoral political action. Ecofeminists have shaped the green movement, but many have withdrawn, and from this disaffection, she worries about the compatibility of liberal feminism and cultural ecofeminism and patriarchal politics. Within the greens, there are conflicts over philosophy, conflicts over representation, and conflicts over strategy. Gaard teaches humanities in Fairhaven College at Western Washington University, and has been a member of both movements. (v8,#3)

Gaard, Greta. "Ecofeminism and Wilderness." Environmental Ethics 19(1997):5-24. I argue that ecofeminism must be concerned with the preservation and expansion of wilderness on the grounds that wilderness is an Other to the Self of Western culture and the master identity and that ecofeminism is concerned with the liberation of all subordinated Others. I suggest replacing the master identity with an ecofeminist ecological self, an identity defined through interdependence with Others, and I argue for the necessity of restoring and valuing human relationships with the Other of wilderness as integral to the construction and maintenance of an ecofeminist ecological self. I conclude that ecofeminists must be concerned with the redefinition, preservation, and expansion of wilderness. Gaard is in women's studies, University of Minnesota, Duluth. (EE)

Gager, Dan, Hendee, John C., Kinziger, Mike, and Krumpke, Ed., "What Managers are Saying--and Doing--about Wilderness Experience Programs," Journal of Forestry 96(no. 8, 1998):33-37. A growing number of organizations take clients/members into the wilderness for personal growth, therapy, or education. Wilderness managers support these programs in principle, but they are concerned about the social and ecological impacts. One conclusion is that often the experience need not be on designated wilderness, as opposed to other forested or wild lands. Given the increasing crowds in wilderness areas, moving elsewhere may be more productive and less disruptive. (EE v.12,#1)

Gagneux, Pascal, James J. Moore and Ajit Varki, "The Ethics of Research on Great Apes," Nature 437(1 Sept. 2005):27-29. Deals with captive great apes, and is often provisional and exploratory. But the authors do hold that there should be no effort to make germline genetic modifications in great apes (no transgenic apes), that research should benefit the apes as well as humans, that apes should be maintained in groups that respect existing social bonds, that there should be no euthanasia as a means of population control, and that humans should intervene for the control of aggressive behavior within or between ape groups. They do not think great apes now in captivity can, or should, be returned to the wild.

Galef, BG; Laland, KN, "Social Learning in Animals: Empirical Studies and Theoretical Models," BioScience 55 (no. 6, June 2005): 489-500. The last two decades have seen a virtual explosion in empirical research on the role of social interactions in the development of animals' behavioral repertoires, and a similar increase in attention to formal models of social learning. Here we first review recent empirical evidence of social influences on food choice, tool use, patterns of movement, predator avoidance, mate choice, and courtship, and then consider formal models of when animals choose to copy behavior, and which other animals' behavior they copy, together with empirical tests of predictions from those models.

Gallagher, Kevin P, and Lyuba Zarsky. *The Enclave Economy: Foreign Investment and Sustainable Development in Mexico's Silicon Valley*. Cambridge, MA: The MIT Press, 2007. The authors question foreign investment as a panacea for developing countries to kick-start modern industries and reduce poverty by showing how foreign investment in the information technology sector failed to deliver this in post-NAFTA Guadalajara. Foreign investment put many local information technology firms out of business, transferred very limited amounts of environmental sound technology, and created an "enclave economy" in which benefits were confined to an international sector not connected to the wider Mexican economy.

Gallagher, Padraig, Flannagan's Naturalized Ethics: Epistemology, Ecology, and the Limits of Pragmatism, M.A. thesis, Colorado State University, 2005. Critique of Owen Flannagan's work, especially his "Ethics Naturalized as Human Ecology" (1995) and his "pragmatic naturalism." Flannagan claims a parallel between biological ecology and human ecology through the concept of "flourishing," which has to be localized, flourishing in particular environments. Flannagan does recognize some transcultural human universals, but these nevertheless take their specifics in local cultural contexts. Gallagher argues that Flannagan is "methodologically infirm," because of the lack of criteria with which to judge better and worse in these locally flourishing groups, an evaluation needed for humans with their options in life choices, but not needed in biological ecology, where ethical choices do not apply.

Gambell, Ray, "Whaling: A Christian Perspective," Science and Christian Belief 2(no. 1, April 1990):15-24. Dr. Ray Gambell is the Secretary of the International Whaling Commission and has been involved with the biology and management of whales since 1963. Whaling has a long history of depleting successive stocks and the whale has become the symbol of our mishandling of environmental matters in general. The biblical foundation for the human dominion of nature should be the source of a sound conservation ethic. It implies responsible stewardship, including the taking of no more than sustainable harvests. In the case of whales this has not happened, through ignorance and greed. The problem of humane killing of animals is highlighted, and whalers ought to cause death within a few minutes. The question of whether or not whales are intelligent is left open, but they are not made in the image of God, and are not, therefore, the equals of humans. Certain Arctic communities are dependent on whales with no reasonable alternatives available. Gambell is sensitive to the issue of whether humans ought to kill whales at all, but disagrees with Tom Regan's claim that whales have a right to life. (v1,#3)

Gamborg, C. & Larsen, J.B. 2005. "Towards more sustainable forestry? The ethics of close to nature forestry." Silva Carelica 49:55-64. Across Europe, even aged, production oriented, intensively managed tree plantations are beginning to be regarded in the same way as old industrial complexes; they belong to a different era and should be abolished or converted to something else. What exactly should these "conventional" forests be converted into? For many, a promising approach to meet these new demands and to achieve more sustainability seems to be the management philosophy dubbed "close to nature." Even though this view has a lot to say for itself, there are problems that need attention from both scientific and ethical perspectives.

Gamborg, C. and Rune, F., "Economic and Ecological Approaches to Assessing Forest Value in Managed Forests: Ethical Perspectives," Society and Natural Resources 17(no. 9, 2004): 799-815(17). (v.14, #4)

Gamborg, C. & Larsen, J.B. 2003. "'Back to nature:' A Sustainable Future For Forestry?" Forest Ecology and Management 179: 559-571. We examine a trend in forestry which may be dubbed 'back to nature' and ask if it offers a sustainable future for forestry. We analyze what is actually meant by 'back to nature', which type of nature we want to 'get back' to, and how ensuing silvicultural philosophies can be defined. It might be difficult to pinpoint what a sustainable future for forestry entails, but it is clear that a sustainable future for forestry to a greater extent than previously will require balancing commodity and environmental and nature values both against one another and against any concerns felt to be relevant by the various stakeholders.

Gamborg, Christian and Sandoe, P. 2004. "Beavers And Biodiversity: The Ethics Of Ecological Restoration." In: Philosophy and Biodiversity. Oksanen, M. (ed.). New York: Cambridge University Press, pp. 217-236. We use the case of beaver reintroduction in southern Scandinavia to illuminate

philosophical issues underlying the value of biodiversity. Beaver reintroduction has been justified primarily on an ecological basis, defended on the grounds that it restores species richness and maintains evolutionary and ecological processes. However, as this case study illustrates, basic ethical questions regarding the origin and character of nature's value bear upon these factual issues. Appeals to the powerful concept of biodiversity are made both by the advocates and opponents of restoration, but with significantly different results. Gamborg is at the Danish Centre for Bioethics and Risk Assessment, The Royal Veterinary and Agricultural University, Copenhagen, Denmark.

Gamborg, Christian, "The Acceptability of Forest Management Practices: An Analysis of Ethical Accounting and the Ethical Matrix," Forest Policy and Economics 4(2002):175-186. Stakeholder approaches to forest management. The public is increasingly sensitive to, and aware of, the broader impact of forest management, not only on human welfare, but also on environmental values, such as nature conservation and biodiversity. Gamborg is at the Danish Forest and Landscape Research Institute, Department of Forestry, Horsholm, Denmark.

Gambrel, Joshua Colt. *The Virtue of Simplicity*. M.A. Thesis, Colorado State University, Spring 2008. Modern American life has become increasingly complex. A paradigm shift is needed, and this transformation can be accomplished by cultivating the virtue of simplicity, with a deeper questioning and discovering of more lasting needs and interests. A voluntary simplification of life questions our over-consumptive lifestyles, especially the impact on the ecosphere. Simplifying our lifestyles helps us produce empowerment, equity, and justice. The virtue of simplicity addresses responsibilities to us, our families, our place, and to the environment and animals; it means giving to ourselves a higher quality of life. The principal advisor was Philip Cafaro.

Gardner, Howard, *Intelligence Reframed*. New York: Basic Books, 1999. Gardner here adds a "naturalist intelligence" (pp. 48-52) to his earlier seven intelligences: linguistic, logico-mathematical, musical, bodily-kinesthetic, spatial, interpersonal, and intrapersonal. Those gifted with naturalist intelligence are unusually sensitive to natural phenomena. Gardner thinks such naturalist intelligence has not been previously recognized or studied by psychologists. He also considers two further intelligences: spiritual and existential, but is less sure about the distinctiveness of these. Gardner is a psychologist at Harvard University.

Gardner, Stephen M., "A Perfect Moral Storm: Climate Change, Intergenerational Ethics and the Problem of Moral Corruption," Environmental Values 15(2006): 397-413. The peculiar features of the climate change problem pose substantial obstacles to our ability to make the hard choices necessary to address it. Climate change involves the convergence of a set of global, intergenerational and theoretical problems. This convergence justifies calling it a 'perfect moral storm'. One consequence of this storm is that, even if the other difficult ethical questions surrounding climate change could be answered, we might still find it difficult to act. For the storm makes us extremely vulnerable to moral corruption. (EV)

Gare, Arran, Postmodernism and the Environmental Crisis. New York: Routledge, 1995. 192 pages. \$ 16.95, softcover. The first book to combine advanced cultural theory and environmental philosophy in a radically new vision--a postmodern "grand narrative." Marxist and postmodern approaches alike have failed to theorize the links between the ecological crisis, the globalization of capitalism, and the fragmentation and the disintegration of modernist culture. A successful ecological politics needs to forge a new worldview out of the postmodernist critique of Western civilization and a global ecological perspective. Gare is in philosophy at Swinburne University, Australia. (v6,#4)

Gare, Arran, Beyond European Civilization: Marxism, Process Philosophy and the Environment. Bungendore, NSW, Australia: Eco-Logical Press, 1993. Australian \$ 21. Offers an alternative future. Part I. Marxism was appropriated primarily by Russians to assimilate the domineering world orientation of Western Europeans to Russian culture, and yet to defend Russia from Western domination. So it is not surprising that the Soviet Union proved as environmentally destructive as the West. But there is a radical dimension to Marx's critique of capitalism that has been taken up and developed in Russia by Aleksandr Bogdanov, seeking to create a radically new culture. This movement needs to be resurrected. Part II. Process philosophy reconceives people as creative participants in the becoming of nature. On this foundation, and new ethics and political philosophy can be elaborated, and joined with the movement resurrected in Part I, to create an ecologically sustainable, post-European civilization. Reviewed in Environmental Values 4(1995):278-280 by Susan Armstrong. (v4,#4)

Gare, Arran. Nihilism Inc.: Environmental Destruction and the Metaphysics of Sustainability. Sydney: Eco-Logical Press, 1996. This work attempts to explain the failure of humanity effectively to confront the global environmental crisis, and thereby to reveal what is required to overcome it. The destruction of the environment on a global scale is the legacy of the expansion and domination of the world by European civilization, a civilization that is inherently destructive and implicitly nihilistic. Ecocide is characterized as applied nihilism. Environmentalists have failed because they have not fully appreciated the nature of this civilization, an appreciation that requires an understanding of the history and dynamics of European culture and its offshoots from Ancient Greece to the present. The first part of the book analyzes the origins and dynamics of Western civilization to reveal the origins of nihilism and to show how in the modern world nihilism has come to be embodied by institutions and individuals, while the second part is devoted to analyzing Marxism, Russian culture and the Soviet Union as a failed alternative to Western culture. These analyses reveal the need for a radical cultural transformation, a transformation which can only be effected on the foundation of a new metaphysics. The final part offers the required metaphysics--a revised version of process philosophy reformulating and integrating the insights of Hegel and those inspired by him--to clear the way for the creation of an environmentally sustainable civilization. Gare teaches philosophy at Swinburne University, Melbourne. (v8,#1)

Garrett, Jan, "Aristotle, Ecology and Politics: Theoria and Praxis for the Twenty-First Century." In Creighton Peden and Yeager Hudson, eds., Communitarianism, Liberalism, and Social Responsibility (Lewiston, NY: The Edwin Mellen Press, 1991). Studies in social and political theory, v. 14. Social philosophy today; no. 6 (Papers from the International Social Philosophy Conference in Vermont in 1990). Environmental philosophers frequently differ over whether the proper motivation for environmental concern is love of nature or concern for human good. Aristotelian conceptions of knowing, education, action, and community can be used to construct an attractive middle road. Although a certain kind of ecological knowledge disposes us to wish well toward the ecosystems with which our lives are entwined, this falls short of an adequate politics, which must make human beings the primary focus and appeal to the human good. Though ecosystems are communities that warrant appropriate respect, they cannot inspire as intense a commitment as can social communities. Anthropocentric arguments for preserving such ecosystems will have greater ethical force, because our duties to other humans are stronger and the sense of solidarity within human communities is greater. Garrett is in philosophy at Western Kentucky University. (v5,#1)

Gault, Richard. "In and Out of Time." Environmental Values 4(1995):149-166. This paper explores the nature of time and its relation to our concerns for the future. It is shown how a new sense of time, chronological time, emerged with the rise of science and modernity. This now familiar time is rarely questioned. Yet, it is argued, this time is intimately bound up with our contemporary problems and our failure to effect solutions. In analysing chronological time it is revealed that the future is devoid of reality in it. This absence of a real sense of the future explains our careless despoiling of the environment. To save our environment we need to resurrect a real sense for the future: only then can the future be truly valued. This means re-discovering another sense of time. This other time is named kairological time. In kairological time there is a more vivid awareness of the future. In this time, too, new ways of acting for the future are opened up. Possibilities for a wiser way to the future in part stem from a reevaluation of the past. So the sense of being out of time to save ourselves and our planet can be overcome by a living in this other time, kairological time. KEYWORDS: Time, future, philosophy of technology, history of time, history of science. Gault is in department of philosophy, King's College, Aberdeen. (EV)

Gaus, Gerald F., "Respect for Persons and Environmental Values." Pages 239-264 in Kneller, Jane, and Axinn, Sidney, eds., Autonomy and Community: Readings in Contemporary Kantian Social Philosophy. Albany: State University of New York Press, 1998. When it comes to the treatment of animals and, especially the nonsentient environment, Kantian liberalism--like Kant's theory itself--strikes many as inadequate. Kant's theory is "person chauvinism." Is Kant hostile to including environmental values in the moral realm? Answering this question is surprisingly complex. It is true that a basic and widely embraced Kantian liberal argument puts supreme value on agency and project pursuit and this makes it well-nigh impossible to protect environmental values. But much contemporary Kantian liberalism goes astray because it misconstrues the nature of personhood and autonomy. Gaus defends an alternative understanding that is truer to Kant's own conception and provides a reformulated Kantian liberalism that can take environmental value seriously. Nevertheless, this revision will not satisfy the demands of many environmental philosophers. The fundamental commitments of Kantian liberalism preclude its being considered an environmental ethic. Gaus teaches philosophy and political science at the University of Minnesota, Duluth. (v9,#2)

Gaus, Gerald F., Value and Justification: The Foundations of Liberal Theory (Cambridge: Cambridge University Press, 1990). Part I is a theory of value. Part II is a theory of moral justification. Part I

concludes with a brief section on "Anthropocentrism and the Environment" (pp. 247-250). Gaus's "Affective-Cognitive Theory in no way precludes environmental objects or ecosystems from being rationally valued for themselves; a rational valuer may even see them as having a greater intrinsic value than humans. ... So, far from opposing ascriptions of intrinsic value to the environment, the Affective-Cognitive Theory has no difficulties embracing the qualities of environmental objects and systems to which environmental philosophers typically point as grounds of their intrinsic value. Richness, complexity, diversity, and organic unity are precisely those properties that evoke interest and so ground intrinsic valuing." Nevertheless such valuing is an activity of humans or other affective-cognitive valuers, and the question "Would the environment have value if there were no humans or valuers?" is "unimportant" or "moot," not false but "pointless." Gavora, J.S., "Practical and Ethical Considerations of Agricultural Research Assistance for the Third World", Journal of Agricultural Ethics 2(1989):307-322. This article focuses on aspects of food production and related agricultural research with specific examples from animal production. It discusses ethics of agricultural research in light of the utilitarian theory and compares livestock production in developing and developed countries. The article reviews the current status of biotechnology in developing countries and discusses several advanced animal technologies. It emphasizes the need for detailed assessment of potential impacts of technology on recipients. Gavora and Lister are in animal research at the Agriculture Centre, Ottawa.

Gebara, Ivone, Longing for Running Water: Ecofeminism and Liberation. Minneapolis: Fortress Press,

1999. Features the daily experiences of poor women in urban areas in Brazil. Indigenous peoples are subject to progressive elimination, racism is on the rise, poverty is the norm, natural "resources" (such as entire jungles, lakes, and rivers) are being swallowed by corporate greed. Her women face garbage in the streets, the smell of raw sewage in the alleys, a lack of drinking water or nutritious food, and inadequate health care. Gebara articulates the links between these daily realities and a patriarchal system of androcentrism and anthropocentrism. She argues for and appeals to a revised worldview that breaks with dualistic systems of domination, her hope based on a comprehensive theological stance. (v.13,#4)

GEC-O: The Newsletter of the ESRC Global Environmental Change Programme has produced its first two issues, with a circulation of over three thousand. This newsletter reports on the Global Environmental Change program launched in the United Kingdom by the Economic and Social Research Council and is said to be the largest ever UK social science research program ever undertaken on any topic in the UK. The goal is "to take global environmental issues to the heart of the social sciences in the international debate on global environmental change." The Newsletter will appear three times a year. Wye College also offers correspondence courses in environmental policy and management available to students anywhere in the world. For information contact Michael Redclift, Research Coordinator, ESRC Global Environmental Change Programme, Wye College (University of London), Near Ashford, Kent TN25 5AH, UK. (v3,#4)

Geddes, Robert, ed. Cities in Our Future. Washington, D.C.: Island Press, 1996. 200 pages. \$22.50 cloth. Urban and regional planners, architects, urban designers, and other experts from across North America examine the impact of a city's growth and form on the ability of its citizens to achieve and maintain social equity and environmental health. Case studies of five North American metropolitan areas are presented with analyses of their physical terrain, design, planning, and development. (v7, #3)

Gedicks is professor of sociology at the University of Wisconsin-LaCrosse. (v4,#4)

Geering, Lloyd, "An Ecological Faith for the Global Era," Ecotheology Vol 6 (Jul 01/Jan 02):12-22. lloyd.g@clear.net.nz This article first sketches the secular, global and ecological era that humankind is now entering and shows why conventional Christianity is losing its relevance. It then discusses Christianity as a fluid cultural stream (rather than something with an unchangeable essence) that has the capacity to meet the needs of the emerging global culture. It explores, albeit tentatively and sketchily, the way in which such basic Christian concepts as God and Jesus Christ may continue to be drawn upon to refer to and nurture the religious experience of awe, wonder, gratitude and obligation in today's cultural and ecological context. It suggests ways in which the traditional religious rituals and festivals may be redirected to the celebration of the planetary conditions of life. It ends with an outline of spirituality in the global era.

Geist, H. J. and Lambin, E. F., "Dynamic Causal Patterns of Desertification," BioScience 54(no. 9, 2004): 817-829(13). Using a meta analytical research design, we analyzed subnational case studies (n =3D 132) on the causes of dryland degradation, also referred to as desertification, to determine whether the proximate causes and underlying driving forces fall into any pattern and to identify mediating factors, feedback mechanisms, cross scalar dynamics, and typical pathways of dryland ecosystem change. Our results show that desertification is driven by a limited suite of recurrent core variables, of which the most prominent at the underlying level are climatic factors, economic factors, institutions, national policies, population growth, and remote influences. At the proximate level, these factors drive cropland expansion, overgrazing, and infrastructure extension. Identifiable regional patterns of synergies among causal factors, in combination with feedback mechanisms and regional land use and environmental histories, make up specific pathways of land change for each region and time period. Understanding these pathways is crucial for appropriate policy interventions, which have to be fine tuned to the region specific dynamic patterns associated with desertification. (v.14, #4)

Understanding these pathways is crucial for appropriate policy interventions, which have to be fine-tuned to the region-specific dynamic patterns associated with desertification.

Gelbard, Alene, "Population Stabilization, Human," Encyclopedia of Biodiversity 4: 799-810. Human population change has three components: births, deaths, and migration. On a global level, only births and deaths determine changes in population size. In the 1990s, more than 70 million people were added to the world's total population each year and it took only 12 years for the world's population to increase from 5 to 6 billion people. This growth will continue into the twenty-first century. How much growth will occur, and how quickly, and when or whether this growth will stabilize, depends on a host of factors. In

1994, the world community agreed on the need to stabilize global population growth. This article describes the history of global population growth, factors associated with this growth, and how countries view this growth. It concludes with a discussion of prospects for the stabilization of population in the future. (v.11,#4)

Gelderloos, Orin, G., Eco-Theology. Glasgow: Wild Goose Publications, 1992. (Wild Goose Publications, Pearce Institute, 840 Govan Road, Glasgow G51 3UU, U.K.) 75 pages. Paper. ISBN 0 947988 55 6. Gelderloos examines post-Enlightenment translations of the Bible to find them biased by a cultural negation of nature. Bringing out fresh interpretations of language and context, he finds that the Hebrew and early Christian cultures were more congenial to modern ecological knowledge. This bridges the divide between scientific and theological perspectives, and uncovers much that is of ecological value in the biblical teachings. He hopes to reconcile the false humans/nature dichotomies of the Judeo-Christian tradition in the West and to rediscover an ecological harmony within the roots of that tradition. Wild Goose Publications is the publishing division of the Iona Community in Scotland. Gelderloos is professor of biology and environmental studies at the University of Michigan-Dearborn and has recently been visiting professor at the Centre for Human Ecology, University of Edinburgh. (v5,#1)

Gelernter, David, "In Rats We Trust: Making a Moral Case Against the Tyranny of Environmentalism." The Washington Post, November 17, 1996, p. C1, C5. "There is an anti-environmentalist position, with arguments and moral claims that are at least as compelling as the other side's." Gelernter cites the costs people have undergone to save the kangaroo rat; they were asked to create firebreaks by mowing rather than plowing up habitat, and, in a subsequent fire, some homes burned (although the General Accounting Office concluded no firebreaks would have worked). "Do we have a moral duty to ensure that every gene pool last forever? I can't see why we should." "We anti environmentalists hold to the Judeo-Christian view that man is emphatically not part of nature. We hold that human life has a different kind of value from animal life; that protecting and preserving human life is a moral duty that sweeps away all 'duties' to nature, and the very idea of duty to nature. ... Environmentalism started as a noble cause, but a Jew or Christian today has a moral obligation not just to disapprove of it but to fight it." Gelernter is a Yale University computer science professor. Good article to provoke class discussion. With reply: Schwartz, Daniel, "A Rabbi's Reply: In God's Green Earth We Trust." The Washington Post, December 1, 1996, p. C2. (v7,#4)

Worst oil spill in the Delaware river in nearly a decade, 30,000 gallons leaked from a gash in a Greek-owned ship, flying a Cyprus flag, and importing oil from Venezuela. (v.14, #4)

George, Kathryn Paxton, "Biodiversity and Biotechnology", Journal of Agricultural Ethics 1(1988):175-192. Five arguments which attempt to ground our moral concern for biodiversity are reviewed and critiqued, not only for their consistency, but also for their power to move us to action. The final section of the paper shows how conflicts in the values of personal and environmental health can impair ethical action and especially policy formation. George is in philosophy, veterinary microbiology and pathology at Washington State University, Pullman.

George, Kathryn Paxton, "So Animal a Human..., or the Moral Relevance of Being an Omnivore", Journal of Agricultural Ethics 3(1990):172ff. It is argued that the question of whether or not one is required to be or become a strict vegetarian depends, not upon a rule or ideal that endorses vegetarianism on moral grounds, but rather upon whether one's own physical, biological nature is adapted to maintaining health and well-being on a vegetarian diet. Even if we accept the view that animals have rights, we still have no duty to make ourselves substantially worse off for the sake of other rights-holders. It is argued that generalizing the vegetarian ideal as a social goal for all would be wrongful because it fails to consider the individual nutritional needs of humans at various stages of life, according to biological differences between sexes, and because it would have the eugenic effect of limiting the adaptability of the human species. George is in philosophy at the University of Idaho, Moscow.

George, Kathryn Paxton, " The Use and Abuse of Scientific Studies", Journal of Agricultural and Environmental Ethics 5(1992)217-234. Professor Pluhar's attempts in "Who Can be Morally Obligated to be a Vegetarian?" to defeat my scientific claims are specious. Her methods violate the canons of fair reasoning. In contradistinction from good scientific reasoning, she downplays or ignores contravening causal explanations, relies on only a few studies or even single instance "data", takes hypotheses as fact, freely reinterprets conclusions and comments to suit her argument and nowhere cites the results of nutritional reviews from respected journals which would seriously undermine her position. George is in philosophy at the University of Idaho, Moscow.

George, Kathryn Paxton, Animal, Vegetable, or Woman: A Feminist Critique of Ethical Vegetarianism. Albany: State University of New York Press, 2000. Challenges the views of Tom Regan, Peter Singer, Carol Adams, and Dean Curtin, who assume the Principle of Equality to argue that no one should eat meat. These renowned individuals also violate the Principle of Equality, because they place women, children, adolescents, the elderly and many others in a subordinate position. An analysis of the nutritional literature on vegetarianism. Inconsistency arises in every major argument for ethical vegetarianism. Her own view is "feminist aesthetic semi-vegetarianism." George teaches philosophy at the University of Idaho. (v.11,#3)

George, Kathryn Paxton, "Discrimination and Bias in the Vegan Ideal", Journal of Agricultural and Environmental Ethics 7(1994):19-28. Traditional moral theorists (such as Evelyn Pluhar and Gary Varner

whose essays appear in this issue) argue that those who are at risk would be excused from a duty to attain the virtue associated with ethical vegan lifestyles. The routine excuse of nearly everyone in the world besides adult, middle-class males in industrialized countries suggests bias in the perspective from which traditional arguments for animal rights and (utilitarian) animal welfare are formulated. George is in philosophy at the University of Idaho, Moscow.

George, Kathryn George, "Use and Abuse Revisited: Response to Pluhar and Varner", Journal of Agricultural and Environmental Ethics 7(1994):41-76. In her recent "Counter-Reply" to my views, Evelyn Pluhar defends her use of literature on nutrition and restates her argument on moral vegetarianism. In his "Vegan Ideal" article, Gary Varner claims that the nutrition literature does not show sufficient differences among women, men, and children to warrant concern about discrimination. In this response I show how Professor Pluhar continues to draw fallacious inferences and avoids the main issue in my ethical arguments. I also argue that Professor Varner fails to make his case because he offers virtually no evidence from scientific studies on nutrition. Neither Varner nor Pluhar have responded sufficiently to the real issue in my arguments, that of discrimination and bias in the vegan diet. George is in philosophy at the University of Idaho, Moscow.

Gerber, Leah R., et al., "Do the Largest Protected Areas Conserve Whales or Whalers?" Science 307(28 January 2005):525-526. There are huge ocean areas in southern oceans that are protected areas but a main problem is that whales migrate out of these areas. New proposals from an International Whaling Commission study group. Gerber is in ecology, Arizona State University.

Gerber, Leah R. and DeMaster, Douglas P. "A Quantitative Approach to Endangered Species Act Classification of Long-Lived Vertebrates: Application to the North Pacific Humpback Whale." Conservation Biology: The Journal of the Society of Conservation Biology 13(No. 5, Oct. 1999):1203- . (v10,#4)

Gerber, Lisa, "Standing humbly before nature," Ethics and the Environment 7(no. 1, 2002):39-53. Humility is a virtue that is helpful in a person's relationship with nature. A humble person sees value in nature and acts accordingly with the proper respect. In this paper, humility is discussed in three aspects. First, humility entails an overcoming of self-absorption. Second, humility involves coming into contact with a larger, more complex reality. Third, humility allows a person to develop a sense of perspective on herself and the world. (E&E)

Gerber, Lisa, "The Art of Intimacy," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter

2001):79-83. This paper is an exploration of intimacy with non-human nature. I show that intimacy is like friendship in that it is a close and familiar relationships that develops over time and is marked by care and concern. Just as we have good reasons to value and promote friendships, we also have good reasons to value and promote intimacy with non-human nature. Gerber teaches in the University Honors Program, University of New Mexico, Albuquerque. (v.13,#2)

Gerber, Lisa, "The nature of water: Basia Irland reveals the 'is' and the 'ought'," Ethics and the Environment 8(no. 1, 2003):37-50. Basia Irland is an artist whose work revolves around water. Her vision is wide and she addresses ecological, social, and policy issues. Many of her works consist of portable sculptures which house maps, videos, natural objects, water samples, hydrologic reports, and research. In this paper I focus on two of her pieces, Desert Fountain and the Gathering of Waters project. I find these two pieces especially illuminating, because Irland reveals the nature of water, and also illustrates what our relationship to water should be. The ethical dimension of these pieces illustrates such values as harmony and reciprocity. Her work is a powerful statement about how we, individually and collectively, should interact with the natural world. I explore each of these pieces in turn, allowing her work to make the connections between what is and what ought to be. (E&E)

Gerber, Lisa . "What is So Bad about Misanthropy?" This paper is an exploration of the vice of misanthropy particularly as it manifests itself in people who love nature. Misanthropy is a hatred and disgust of humans, particularly of a group of humans. I look to wilderness to illustrate the vice of misanthropy. With regard to wilderness, misanthropy functions in three distinct spheres. First, there is misanthropy in the use of wilderness to flee other people. Second, there is misanthropy in the assumption that humans taint the wilderness. Finally, there is misanthropy in the assumption that humans can only relate to nature in a way that is harmful. In the end, we need to avoid misanthropy and its attendant despair. It is important that we see ourselves, not as a determined mass of people, but rather as individual people who are able to create positive change. Environmental Ethics 24(2002):41-55. (EE)

Gerber, Lisa, Environmental Virtues and Vices (Narcissism, Misanthropy, Humility, Attentiveness, Intimacy), Ph.D. thesis, 1999, Department of Philosophy, University of New Mexico. Virtue ethics is a better approach to environmental ethics than the extentionist position which allocates rights to animals, or the utilitarian position which takes into moral consideration all sentient creatures, or the land ethic position which seeks to promote the integrity and beauty of the biotic community. (1) Virtue ethics coherently explains why diverse examples, such as the killing of a sled dog and the destruction of a natural formation, are wrong. (2) More importantly, virtue ethics offers concrete ways in which to cultivate our characters in order to improve our relationship with nature. I explicate the vices of narcissism and misanthropy, and the virtues of humility, attentiveness, and intimacy. The adviser was Fred Schueler. (v.13,#4)

German Advisory Council on Global Change. *Climate Change as a Security Risk*. London: Earthscan Publications, 2008. This new report is based on the findings of research into environmental conflicts, the causes of war, and of climate impact research. It appraises past experience but also ventures to cast a

glance far into the future in order to assess the likely impacts of climate change on societies, nation-states, regions and the international system. The core message of this report is that without resolute counteraction, climate change will overstretch many societies' adaptive capacities. In some regions of the world, this may result in internal destabilization processes and state failure with diffuse conflict structures, inter-state conflicts and an overstretching of the international system. Classic security policy cannot respond adequately to these new threats to international stability. Climate policy and strategies for adaptation to climate change are thus emerging as key elements of preventive security policy.

Gerrie, James B., "Environmental ethics: should we preserve the red herring and flounder?" Journal of Agricultural and Environmental Ethics 16(2003):63-76. Based

on a survey of some popular introductory anthologies and texts, I argue from my experience as a philosopher of technology that environmental philosophy might be conceived by some researchers in the field in terms of an overly narrow theoretical foundation. Many of the key figures in the field take as a basic assumption that the environmental crisis is fundamentally best explained in terms of some failing in the metaphysical outlooks of most people. However, philosophers of technology typically present at least two additional types of general explanation of the crisis. Environmental ethicists might benefit from consideration of these alternative ways of explaining the root causes of the ecological crisis. KEY WORDS: environmental ethics, philosophy of technology, technological dependency. (JAEE)

Gertler, Nicholas, and Ehrenfeld, John R., "A Down-to Earth Approach to Clean Production," Technology Review (MIT), Feb//Mar. 1996, pp. 48-56. Industrial symbiosis, modeled on the natural world where organisms rely on each other for nutrients, promises substantially to cut the environmental--and economic--costs of manufacturing. Ehrenfeld directs MIT's Program on Technology, Business, and Environment. (v.11,#1)

Gezon, Lisa L. *Global Visions, Local Landscapes: A Political Ecology of Conservation, Conflict, and Control in Northern Madagascar*. Walnut Creek, CA: AltMira Press, 2006. Gezon argues that local events continuously redefine and challenge global processes of land use and land degradation. She challenges analytical distinctions between separate "local" and "global" spaces, rather proposing that the global is one aspect of the local, to the extent that people in any given locale must act within the parameters of policies, authorities, and material conditions that have sources outside of the reach of immediate local networks. Her ethnographic study of Antankarana-identifying rice farmers and cattle herders in northern Madagascar weaves together an analysis of remotely sensed images of land cover over time with ethnographies of situated negotiations between human actors. She focuses in particular on the interplay of political authorities-including family-based elders, a regional indigenous authority, and an NGO charged with enforcement of conservation policies-in the context of specific contests over resource access.

Gibbons, Ann. "Food for Thought." *Science* Vol. 316, no. 5831 (15 June 2007): 1558-60. Did the first cooked meals help fuel the dramatic evolutionary expansion of the human brain? Brains take a lot of energy, especially human brains, and this takes food. Also the human brain in evolutionary history expands greatly in size and rapidly. Richard Wrangham, Harvard primatologist, has been arguing that as humans learned to cook food this gave them a new energy source which fueled the rapid expansion of their brains, compared with other primates, such as chimpanzees, who never learned to cook. But his critics say that the timing is wrong: humans had big brains long before there is any evidence they cooked their food. This has led to debate over how long humans have used fire and in what ways. Fire has been used by hominoids for perhaps 800,000 years but there is evidence for cooking over fires only for about 100,000 years.

Gibbons, Ann. "Spear-Wielding Chimps Seen Hunting Bush Babies." *Science* Vol. 315, no. (23 February 2007): 1063. Chimps have been seen thrusting a pointed stick into a hole and pulling out a bush baby and eating it. They have been seen thrusting such sticks dozens of times, but only once with success (in 2,500 hours of observation). Chimps, of course, regularly thrust sticks (smaller ones) into termite mounds, draw it out, and eat the termites. Some wonder if they intend to hunt bushbabies, perhaps they only probe around with sticks and rarely luck up. Nevertheless, primatologists are excited about it.

Predicted effects radically change many of the over 700 wilderness areas in the United States, differing depending on the capacity of species to migrate. Likely there will be catastrophic mortality and the slow assembly of perhaps novel communities. At the same time, conservation of wilderness can help mitigate the effects of global warming. An acre of pine forest can offset the carbon emissions produced by one automobile.

Giljum, Stefan, and Hinterberger, Friedrich, "Wie misst man oekologische Nachhaltigkeit? Ein Vergleich ausgewählter Methoden des 'Physical Accounting' (article in German). How do we measure ecological sustainability? A comparison of selected physical accounting methodologies. Natur und Kultur, Vol. 1/2, 2000, pp. 26-43. Abstract: Energy and materials form the base for all natural and social processes on our planet. Thus, the implementation of ecological sustainability requires methodologies, which represent the metabolism of social systems in physical terms. This article presents four of the most influential approaches in physical accounting and defines criteria for a comparison of these methodologies. Understanding ecological sustainability as a global challenge demands for the application of comprehensive calculation methodologies, which indicate the demand for natural resources independent from the region of their occurrence. Gilkey, Langdon, Nature, Reality, and the Sacred. Minneapolis: Fortress Press, 1993. 266 pages. Paper. Two partial apprehensions of nature have been vying for dominance in this century: religious, void of much influence from science, and scientific, unable to admit any reality beyond the empirical. Both views have led to the exploitation of nature, and the scientific may prove even more devastating from here onward. The fault lies not in the scientific knowledge of nature but in the assumed philosophy of science that accompanies most scientific and technological practice. Scientific knowing needs to be brought into relationship with other complementary ways of knowing, before there can be any adequate understanding of, relationship to, or conservation of the natural world. Gilkey is visiting professor at the University of Virginia, emeritus at the University of Chicago. (v5,#1)

Gillespie, Alexander, International Environmental Law, Policy and Ethics. Oxford, UK: Oxford University Press, 1997, 2000. Anthropocentrism. The self-interest justification for environmental protection. Religious justifications. Aesthetic, cultural, and recreational justifications. The rights of future generations as a justification for environmental protection. The growth of new, non-anthropocentric ideals within international environmental law. The moral considerability of animals. Respect for life. The land ethic.

Anthropocentric justifications are many though problematic, limited and not always coherent (roughly speaking, shallow ecology). These are dominant in international law, but they have increasingly been supplemented by non-anthropocentric considerations of the intrinsic value in nature (roughly speaking, deep ecology). These too are besieged by a number of faults and limitations that prevent them from becoming any panacea for environmental ethics. We need all the good arguments we can get, though we also must remember that summing up limited and contradictory arguments does not necessarily produce a good argument in total. Gillespie, in the Nottingham University Law School, is quite well-versed in philosophical environmental ethics and cites as many ethicists as he does legal documents. (v.13,#2)

Gillespie, Alexander. "Legitimizing a Whale Ethic." Environmental Ethics 25(2003): 395-410. Ethical discussions have entered into the discourse of the International Whaling Commission. In accordance with the existing approach in international environmental law, countries can legitimately choose not to exploit a resource in the traditional sense. Recognition of this possibility is important because it is commonly suggested that countries must adopt a lethal approach to so-called "sustainable whaling" as there are no other legitimate alternatives. However, the precedent of Antarctica suggests otherwise in international environmental law. Moreover, when the possibilities of the nonlethal utilization of whales via operations such as whale watching are examined, the legitimacy of the nonlethal choices is even stronger. (EE)

Gillroy, John Martin, Justice and Nature: Kantian Philosophy, Environmental Policy, and the Law. Baltimore, MD: George Washington University Press, 2001. Criticizing the cost-benefit paradigm, Gillroy proposes an alternative way to conceptualize and create environmental policy, one that allows for the protection of moral and ecological values in the face of economic demands. Drawing on Kantian definitions of who we are as citizens, how we act collectively, and what the proper role of the state is, Gillroy develops a philosophical justification for incorporating non-market values into public decision making His new paradigm for justice toward nature integrates the intrinsic value of humanity and nature into the law. Gillroy is in environmental law and policy at Bucknell University. (v.12,#2)

Gillroy, John Martin. "Public Policy and Environmental Risk." Environmental Ethics 14(1992):217-37. In this essay, I argue that environmental risk is a strategic situation that places the individual citizen in the position of an imprisoned rider who is being exploited without his or her knowledge by the preferences of others. I contend that what is at stake in policy decisions regarding environmental risk is not numerical probabilities or consistent, complete, transitive preferences for individual welfare, but rather respect for the human agency of the individual. Human agency is a prerequisite to one's utility function and is threatened and exploited in the strategic situation that produces the imprisoned rider. This problem is created by the policy maker's assumption that his or her task is to assume rational preferences and aggregate them. The guidelines for evaluation and justification of policy should move beyond welfare preferences and involve an active state protecting human agency and empowering the imprisoned rider. Only in this way can we free all citizens (a priori) from fear of exploitation by those who would impose collective and irreversible risk on each of them in violation of their unconditional right to their own agency. Gilroy is at the Political Science Department, Trinity College, Hartford, CT. (EE)

Gillroy, John Martin, "Kantian Ethics and Environmental Policy Argument: Autonomy, Ecosystem Integrity, and Our Duties to Nature," Ethics and the Environment 3(1998):131-155. In this essay I will argue that, preconceptions notwithstanding, Immanuel Kant does have an environmental ethics which

uniquely contributes to two current debates in the field. First, he transcends the controversy between individualistic and holistic approaches to nature with a theory that considers humanity in terms of the autonomy of moral individuals and nature in terms of the integrity of functional wholes. Second, he diminishes the gulf between Conservationism and Preservationism. He does this by constructing an ideal-regarding conception of the former that values nature not as "merely" a thing to be used by human preferences and translated by markets, but as an essential component and prerequisite to the intrinsic autonomy of human beings. Simultaneously, he argues for a definition of preservation which places responsibility on humanity to harmonize moral agency with the functional integrity of natural systems. Here humanity and nature become the two unique and equally important components of what we might call the greater "Kantian ecosystem." In addition to the theoretical contributions of Kant's approach to our appreciation of the duties we owe to our natural environment, I will also suggest that "Kantian Conservationism" and "Kantian Preservationism" provide a sound moral basis for public policy arguments that wish to take the intrinsic value of humanity and nature into account. By requiring decision makers to consider citizens as ethical ends and nature as a functional end-in-itself, public choice becomes a process of restricting the use of the "kingdom of nature" to the essential requirements of "kingdom of ends." Gillroy is in environmental studies, Bucknell University, Lewisburg, PA. (E&E)

Gilmour, Brad, Huffman, Ted, Terauds, Andy, Jefferson, Charles. "Incentive Problems in Canada's Land Markets: Emphasis on Ontario," Journal of Agricultural and Environmental Ethics 9(1996):16-41. This specific issue addressed in this paper is urban encroachment on agricultural lands, and the problems it poses for both analysis and the conservation of the land resource. The purpose of our discussion is two-fold: (1) to identify where and why traditional analytical and regulatory approaches fail to resolve land use conflicts, and (2) to explore ways and means of resolving some of the dilemmas which society faces in making land use decisions. This paper's contribution is in the spirit of "Getting Incentives Right" for the inter-temporal transfer of wealth, as represented in trade-offs between environmental and resource endowments and human and physical capital. (JEEE) Efforts are placed on identifying what the appropriate price, levy, taxes, and grant ratios "ought" to be in order to encourage individuals in the marketplace to act in society's interest. (JEEE) We have also explored ways of efficiently transmitting those incentives through the market mechanism, without unduly relying on bureaucratic methods or suasion. Emphasis is placed on mechanisms that have little scope for preferential access and are subject to public scrutiny; emphasis on such self-disciplining approaches should result in less effort expended on (unproductive) lobbying activities and bureaucratic administration. Keywords: land use planning, zoning, transferable use rights, traditional benefit-cost analysis. (JAEE)

Gilpin, Robert, and Gilpin, Jean M., Global Political Economy: Understanding the International Economic Order. Princeton, NJ: Princeton University Press, 2001. Multinational corporations have much potential to influence political as well as economic life. The largest multinational corporations, such as General Motors, Ford and Mitsubishi enjoy total sales that exceed the gross national product of all but the most productive nations in the world. But the state can and ought retain its power. The authors advocate a "state-centric realism." The widening gap between the rich and the poor is almost invisible in this analysis.

Gimeno, Paul, "Éthique environnementale, valeur, anthropocentrisme et démocratie," Critique: Revue generale des publications francaises et etrangeres (Paris) 54(no. 612, 1998):225-245. In French. A critical review of some basic positions in "Anglo-Saxon" environmental ethics, Rolston, Callicott, Leopold, Regan, Singer, Taylor, Naess, and others. There are three deadly assumptions held concerning environmental ethics in Europe: (1) It is necessarily founded on a naturalistic theory of value. (2) Its theory of value necessarily reduces the value of human beings to that of the other animals. (3) The two preceding assumptions together determine a politics that contradicts modern democratic theory. These assumptions are false, as can be shown by attention to the writers above. (v.13,#2)

Gingras, Jacqui, "Evoking trust in the nutrition counselor: why should we be trusted?" Journal of Agricultural and Environmental Ethics 18(2005):57-74.

The virtue of trust is central to the work of dietitians working in nutrition counseling, especially in the context of disordered eating/eating disorders nutrition therapy. Indeed, dietitians are purported to be the most trusted source of information on nutrition and food by professional associations such as Dietitians of Canada. Here trust is explored through educational, relational, and virtue theory in order to elucidate trusts meaning and relevance to dietitians work and interactions with each other, including the general public. If dietitians are to continue to be trusted during times of skepticism in expert knowledge, reflexivity, active contestation, and moral testing in the context of our socio-political milieu need be employed so that we as a profession may respond to clients in respectful, authentic, meaningful ways; practices worthy of our trust.

Gladwin, Thomas N., Kennelly, James J., and Krause, Tara-Shelomith, "Shifting Paradigms for Sustainable Development: Implications for Management Theory and Research," Academy of Management Review 20(1995):874-907. Modern management theory is constructed by a fractured epistemology, which separates humanity from nature and truth from morality. Reintegration is necessary if organizational science is to support ecologically and socially sustainable development. Requisites of such development, rejecting the paradigms of conventional technocentrism and antithetical ecocentrism on grounds of incongruences. A more fruitful integrative paradigm of "sustaincentrism" is articulated, and implications for organization science are generated as if sustainability, extended community, and our Academy of Management mattered. The authors are with the Global Environment Program, School of Business, New York University. (v.10,#1)

Glaesel, H, Book Review: "Dobbs, David. The Great Gulf: Fishermen, Scientists, and the Struggle to Revive the World's Greatest Fishery," Society and Natural Resources 15(no.5, 2002):463-464. (v.13, #3)

Glaeser, Bernhard. Environment, Development, Agriculture. Armonk, NY: M.E. Sharpe, 1995. The concept of human ecology might be the ideal means for creating a unified theoretical construct that will enable "greenery" and development to complement, rather than cancel out, each other. (v8,#1)

Glantz, Michael, ed., Drought Follows the Plow. New York: Cambridge University Press, 1994. \$ 19.95. Reversing an 19th century adage of the sodbusters, "rain follows the plow," the contributors here argue just the opposite, that droughts are often human-caused. Most of Earth's fruitful, rain-fed land is already in use. To try to farm marginal land, often arid or semiarid, can hasten agricultural drought. Such regions are ill-suited for farming in the first place and, with misguided human disruptions, a spiraling downward trend initiates, compounded when drought comes. Rich nations, like the U. S. and Australia can buy their way out of droughts, but in a country like Ethiopia, where an elite majority owns the good land and the majority must attempt to survive on marginal land, and where population growth is out of control, mass starvation is the likeliest scenario. Nature is likely to be blamed, because no one in government wants to admit responsibility for inept planning. Glantz is director of the Environmental and Societal Impacts Group at the National Center for Atmospheric Research, Boulder, Colorado. (v5,#4)

Glanz, James, "Sharp Drop Seen in Soil Erosion Rates," Science 285(1999):1187-1188; and Trimble, Stanley W., "Decreased Rates of Alluvial Sediment Storage in the Coon Creek Basin, Wisconsin, 1975-

1993," Science 285(1999):1244-1246. Sharp drop in soil erosion rates? A detailed study, including data across 140 years, shows much erosion earlier, but a sharp decline in recent years. From the 1970's to the 1990's sedimentation rates dropped to just 6% of their earlier peak, owing to better farming practices. But others say the study area is not typical of the United States as a whole, especially not of the western U. S. (v. 10, # 3)

Glaser, Harold, "Naess's Deep Ecology Approach and Environmental Policy," Inquiry 39(no. 2, June, 1996):157-187. "A clarification of Naess's 'depth metaphor' is offered. The relationship between Naess's empirical semantics and communication theory and his deep ecology approach to ecophilosophy (DEA) is developed. Naess's efforts to highlight significant conflicts by eliminating misunderstandings and promoting deep problematizing are focused upon. These insights are used to develop the implications of the DEA for environmental policy. Naess's efforts to promote the integration of science, ethics, and politics are related to the National Environmental Policy Act (NEPA). The action-oriented aspect of deep ecology, its focus upon redirecting environmental policy, is also highlighted. The discussion is framed by Bryan Norton's contention, in Toward Unity Among Environmentalists, that Naess's deep/shallow distinction is not consequential. In the final section some of the uniqueness of Naess's contribution is intimated, the 'sturdiness' of deep ecology's foundation is considered, and directions for future theoretical and practical contributions are suggested. As will be observed, Naess has many important insights to offer, but some vexing issues persist. Glaser is at the New Jersey Institute of Technology, Newark. (v8,#3)

Glaser, Harold. "On Warwick Fox's Assessment of Deep Ecology." Environmental Ethics 19(1997):69-85. I examine Fox's tripartite characterization of deep ecology. His assessment abandons Naess's emphasis upon the pluralism of ultimate norms by distilling what I refer to as the deep ecology approach to "Self-realization!" Contrary to Fox, I argue that his popular sense is distinctive and his formal sense is tenable. Fox's philosophical sense, while distinctive, is neither necessary nor sufficient to adequately characterize the deep ecology approach. I contend that the deep ecology approach, as a formal approach to environmental philosophy, is not dependent upon and embodies much more than any single ultimate norm. I discuss how Naess's deep ecology approach supports a wide diversity of ultimate norms. The only stipulation placed upon ultimate norms, to make them deep ecological ultimate norms, is that the so called deep ecology platform be derivable from them. The deep ecology approach is distinguished, in part, through its focus on diminishing environmentally degrading practices and policies by addressing root causes and by highlighting pseudo-conflicts. I present an interpretation of the deep ecology approach that highlights Naess's emphasis upon assisting individuals to arrive at thoroughly reasoned, consistent, and ecologically sound concrete decisions by supporting them in the articulation of their own personal ecological total views (ecosophies). Glaser is with the El Bosque Pumalin Foundation, San Francisco, and general editor of the selected works of Arne Naess, a nine-volume work to be published by Kluwer in 1998. (EE)

Glazebrook, Trish, "Gynocentric Eco-logics," Ethics and the Environment 10(no. 2, 2005):75-99. I wish to provide a diagnosis and etiology, and suggest a curative possibility for a disease of modernity I will call phallic logic. Symptomatic of this sickness are wide-spread social alienation, global domination and oppression on the basis of gender, race, class and color, and epidemic eco-destruction. A body of critique exists in ecofeminist analyses that experiences these symptoms as a single disease: the phallic logic of modernity. "Logic" in the sense used here is an epistemological term. Phallic logic is the structure of understanding that permeates patriarchy. This logic takes its paradigm from scientific objectivity, but even voices from within the sciences themselves are arguing that contemporary human being must establish new ways of thinking about nature. Glazebrook is in philosophy, Dalhousie University, Nova Scotia. (Eth&Env)

Glazebrook, Trish, "Art or nature? Aristotle, restoration ecology, and flowforms," Ethics and the Environment 8(no. 1, 2003):23-36. Aristotle believed strongly in a distinction between artifact (techne) and nature (physis). He intended by "techne" more than is generally understood by the contemporary term "art," for he meant anything produced by human intention. The key point in distinguishing art from nature for him was that things in nature grow and develop on the basis of an internal principle of change, whereas artistic production requires an outside agent. Reason is requisite for artistic production. Yet some art may not meet this definition: artists may not always have a full conception of the work to be produced prior to its execution. Creativity can be emergent rather than intentional during the productive process, and may arise, for example, from the artist's interaction with the chosen material. Glazebrook is in philosophy, Dalhousie University. (E&E)

Washington, D.C.: Island Press, 1998. \$29.95. 200 pp.

Gleick, Peter H., "Global Freshwater Resources: Soft-Path Solutions for the 21st Century," Science 302(2003):1524-1528. "Twentieth-century water policies relied on the construction of massive infrastructure in the form of dams, aqueducts, pipelines, and complex centralized treatment plants to meet human demands. These facilities brought tremendous benefits to billions of people, but they also had serious and often unanticipated social, economical, and ecological costs. Many unsolved water problems remain, and past approaches no longer seem sufficient. A transition is under way to a 'soft path' that complements centralized physical infrastructure with lower cost community-scale systems, decentralized and open decision-making, water markets and equitable pricing, application of efficient technology and environmental protection." While a soft path seems promising, political will is doubtful. More people lack clean water now than ever before. More lack healthy sanitation now than were alive on the planet in 1940. Gleick is at the Pacific Institute for Studies in Development, Environment, and Security, Oakland, CA.

Globalizations Vol. 5, no. 1 (2008). This issue contains the special forum "Global Action to Combat Global Climate Change." Contents include: (1) "Editorial: The Urgent Need for Global Action to Combat Climate Change" by Mark Armen, M. Martin Bosman, and Barry K. Gills (pp. 49-52), (2) "The Mitigation of Climate Change: Findings of the IPCC Working Group III" by Calum Miller (pp. 53-55), (3) "Combating Global Climate Change: From Light Bulbs to Photovoltaics" by UN Under Secretary General and UNEP Executive Director Achim Steiner (pp. 56-57), (4) "Climate Change as an Emerging Global Issue" by R.K. Pachauri (pp. 58-59), (5) "The Oil Depletion Protocol: A Response to Peak Oil" by C.J. Campbell (pp. 60-62), (6) "The IPCC and the Ozone Hole: A Warning from History" by Jan Oosthoek (pp. 63-66), (7) "Creating Low Carbon Communities: *One Planet Living* Solutions" by Pooran Desai OBE (pp. 67-71), (8) "Priorities for Decision Makers: Tackling Climate Change in a Time of Corporate Globalization" by Benedict Southworth (pp. 72-75), (9) "A New Environmental Deal for the 21st Century" by Susan George (pp. 76-77), (10) "Climate Change and Globalisation are Reinforcing Global Inequalities: High Time for a New Social Democratic Era" by Ulrich Beck (pp. 78-80), (11) "China: Facing the Challenges to Link Climate Change Responses with Sustainable Development and Local Environmental Protection" by Zhang Shiqiu (pp. 81-82), and (12) "Climate Change: A Global Call to Action" by Barry K. Gills (pp. 83-87).

Glosser, James W. and Waggoner, David K., "Animal Welfare Policy in the United States", Journal of Agricultural and Environmental Ethics 6(1993). In the United States there is a wide spectrum of feelings and views about animal welfare. At one extreme there is a view that animals are property, while at the

other extreme are those who believe animals have rights equal to human rights. The issue is complex, open-ended, and in large part still unresolved. If the industry does not effectively address the need for behavioural research on livestock animals, increased pressure will be exerted on Congress to legislate production practices. The U.S. livestock sector has a unique opportunity to bring about positive changes, in a reasonable fashion, in five important areas: (1) To correct misinformation and misconceptions about animal agriculture through educational efforts, especially focussed toward the young consumer; (2) To conduct the necessary research and be able to address concerns in the behavioural area. We presently have an extensive base of knowledge in the areas of production research, husbandry practices and disease prevention, but minimal information about the behaviour of livestock and poultry; (3) To develop self-regulatory practices within specific livestock groups which will satisfy the reasonable concerns of the general public and thus prevent a groundswell of support for government intervention and regulation; (4) To prevent the undue interference of government into livestock practices, as is occurring in other areas; and (5) To ensure that adequate efforts are being undertaken to meet the behavioural needs of livestock given the economic framework in which the industry must operate. Livestock producers should pursue simultaneous actions through self-regulation, public education and research to acquire additional information to fill the data gaps. Glosser is with the Animal and Plant Health Inspection Service, Department of Epidemiology, School of Veterinary Medicine, University of California, Davis, CA 95616. Waggoner is with Marketing and Inspection Services, United States Department of Agriculture, Washington, DC 20250.

Glover, James M., "Soul of the Wilderness Can We Stop Trying to Control Nature?" International Journal of Wilderness 6 (no. 1, April 2000):4-8. "The Western dream of controlling nature is deeply ingrained. Even in wilderness areas, it seems, we can't stop trying to control. I believe we need to take a lesson from Lao Tsu and other Eastern sages and recognize that the world cannot be ruled by interfering." Glover is in outdoor recreation at Southern Illinois University, Carbondale. (v.11,#2)

Glover, Leigh. *Postmodern Climate Change*. New York: Routledge, 2006. Glover discusses international political efforts such as the Kyoto Protocol in order to critique climate change science, global environmental politics, and global environmental management. He argues that modernity's usual economic, governmental, and scientific tools used to control climate change are inherently flawed, and the problem of climate change defies modernity's end.

Godfrey-Smith, William. "The Value of Wilderness." Environmental Ethics 1(1979):309-19. In this paper I explore various grounds on which wilderness can be regarded as something which we should value, and I draw attention to the problems of resolving conflict which are generated by these diverse grounds. I conclude that our attitudes toward nature are partially determined by a background of metaphysical assumptions which derive in particular from the philosophy of Descartes. These metaphysical preconceptions lead to the misconception that various alternative views about the natural environment are mystical or occult. Thus, an alternative non-Cartesian mode of conception involving holistic or systemic modes of thought is required in order to develop a satisfactory basis for our attitude toward the natural world. William Godfrey-Smith is now William Grey. He is in the department of philosophy, Australian National University, Canberra, Australia. (EE)

Godlovitch, Stan, ed., "Symposium: Natural Aesthetics," Journal of Aesthetic Education 33, no. 3., Fall, 1999. (v.13,#1)

Godlovitch, Stan, "Icebreakers: Environmentalism and Natural Aesthetics," Journal of Applied Philosophy 11(1994):15-30. "The only fitting regard for [nature] is a sense of mystery" and "the relevant special sense of mystery is ... a state of appreciative incomprehension, at best an acknowledgment of limits." But this need not involve a sense of awe or the sublime and natural science is irrelevant to nature appreciation. Godlovitch is in Parks, Recreation, and Tourism at Lincoln University, Canterbury, New Zealand. (v7,#2)

Godlovitch, Stan, "Valuing Nature and the Autonomy of Natural Aesthetics," British Journal of Aesthetics 38(no. 2, 1998):180-197. Aesthetic value in nature compared with aesthetic value in art works. Aesthetic responses to nature are numerous and multifarious and there seems to be no privileged aesthetic stance on which the aesthetic value of nature is to be judged. This also means that the science-based approach to aesthetics is not privileged (contra Carlson). Positive aesthetics of nature analyzed. There are numerous difficulties to making clear or affirming the positive aesthetics of nature (contra Carlson and Hargrove). These include the scope of the claim (landscapes, ecosystems, individual organisms?) and whether there can still be grading (more, less beautiful) even within positive aesthetics.

A more satisfactory account might be to take nature as it is in itself out of the realm of aesthetic value (as it has been removed from the realm of moral value). Nature is beyond beauty and ugliness. Still, an appropriate respect for nature, perhaps also a sense of mystery before the creativity and biodiversity there, ought to remain. "Nature as such must somehow be taken as it is, that it constitutes an autonomous and inexhaustible domain, that human-centered, nature-related distinctions are fundamentally limited, that nature is bound to outstrip our comprehension of and regard for it at any time in our history. Reflected in these views is nature as ... a 'magic well'." This will result in conservation and caring for nature. Godlovitch is at Lincoln University, Canterbury, NZ.

Godlovitch, Stan, "Valuing Nature and the Autonomy of Natural Aesthetics," British Journal of Aesthetics 38(no. 2, 1998):180-197. (v.13,#4)

Godlovitch, Stan, "Offending Against Nature," Environmental Values 7(1998): 131-150. Some environmental views characterise the human abuse of nature as an offence against nature itself. What conception of nature would best fit that characterisation? To focus upon such a conception, aesthetic offences against nature are examined and distinguished at the outset from moral offences. Aesthetic offences are divided into those internal to our cultural outlook and external to it. The external outlook, conceiving nature as a thing wholly apart from us, is shown to be necessary to any view of nature being offended against. Central to the external outlook is a conception of nature as the victim of offence without ever being itself an offending agent. Best fitting this is the notion of nature as primordially innocent. Given this metaphorical extension, the awkward consequence arises that any human use of nature constitutes thereby an abuse of it from the external standpoint. KEYWORDS: natural aesthetics, environmental ethics, nature, culture. Stan Godlovitch is at Lincoln University, New Zealand. (EV)

Godlovitch, Stan. "Things Change: So Whither Sustainability?" Environmental Ethics 20(1998):291-304. Two broad metaphysical perspectives deriving from Parmenides and Heraclitus have implications for our notion of sustainability. The Parmenidian defends a deep-seated orderliness and permanence in things, while the Heraclitian finds only chance and change. Two further outlooks, the nomic (or the big-picture

scientific) and the prudential, present differing accounts of our place in the world. While the nomic outlook accepts nothing privileged about the human perspective or even life itself, the prudential outlook is obviously welfare-centered. It is argued that nomic views, whether Parmenidian or Heraclitian, fail to provide any rationale for sustainability measures or concerns. The only such rationale comes from Parmenidian prudentialism, which, I argue, can operate only if it disowns at its peril the nomic point of view and couches sustainability entirely under the rubric of maximizing certain preferred opportunities drawn from collective self-love. But doing so merely evades rather than answers the tension imposed by the nomic Heraclitian for whom nothing lasts and nothing human counts specially in the measure. The liabilities of Parmenidian prudentialism are examined and found to be too great for any consistent notion of sustainability to bear. Godlovitch is in philosophy, Lincoln University, Canterbury, New Zealand. (EE)

Godzinski, Ronald Peter, Jr., Hume's Emotivism and Callicott's Environmental Ethic. Colorado State University, Philosophy M.A. thesis, fall 1997. J. Baird Callicott's environmental ethics is founded on David Hume's moral epistemology. Hume has problems with the is/ought fallacy, which Callicott believes he can overcome with the model of environmental health. But making a rational appeal to persons to act ethically because they are motivated by environmental health is more complex than Callicott realizes. Further, Hume is either a subjectivist or an emotivist in ethics, and both views have been subjected to severe criticisms. Callicott's environmental ethics needs to face these criticisms. In fact, Callicott's whole line of reasoned argument in defense of ecosystems and duties to conservation is not really permissible, if Callicott really follows Hume, who does not concede the power of reason to motivate behavior. Goerner, Sally. "Chaos, Evolution and Deep Ecology." Pages 17-38 in Robin Robertson and Allan Coombs, eds., *Chaos Theory in Psychology and the Life Sciences*. Mahwah, NJ: Lawrence Erlbaum. The main concept in chaos theory is nonlinearity, in which opposing tendencies may be built into a single system, resulting in a world that is extremely versatile and subtle. Chaos theory more accurately describes the world in its ability to account for the phenomena normally labeled as accidental, anomalous, or mysterious. The evolving ecological universe is lawful and physical but not completely predictable, controllable, or knowable. Order is hidden in chaos, a result of interdependent variables coaffecting each other, which creates wholes out of parts. Such themes can be integrated into deep ecology.

Goerz, Catherine S., The Rhetoric of Earth First!: An Organic Systems Analysis. M.A. thesis, Speech Communication Department, Colorado State University, Fall 1996. An analysis of the independent and adaptive nature of the radical environmental organization Earth First!. Earth First! was founded on the principles of biocentrism and ecodefense for the purpose of protecting the wilderness. The organization responded to the perceived environmental crisis by aggressively confronting and resisting the political institutions and corporations responsible for the damage. Strengthened by diverse internal structures and human resources, the movement attempted to persuade the establishment to reevaluate current environmental policy and to make changes in favor of ecological preservation and regulation. Earth First!'s rhetoric is examined with an organic systems analysis. This approach to social movements conceives the organization to be a collectivity that must interact and adapt with the external environment in order to evolve. By analyzing the internal relationships and resources, the communication channels, and rhetorical environment surrounding the movement, the revolutionary nature of Earth First! is revealed. The thesis advisor was James R. Irvine. (v9,#2)

Goetzl, Alberto, "Consumption and Concerns: A Delicate Balance," Journal of Forestry 98(no.10, OCT 01 2000):19- . Americans need to make the connection between their demands as consumers and their concerns about natural resources. (EE v.12,#1)

Goff-Yates, Amy L. "Karen Warren and the Logic of Domination: A Defense." Environmental Ethics 22(2000):169-181. Karen Warren claims that there is a "logic of domination" at work in the oppressive conceptual frameworks informing both sexism and naturism. Although her account of the principle of domination as a connection between oppressions has been an influential one in ecofeminist theory, it has been challenged by recent criticism. Both Karen Green and John Andrews maintain that the principle of domination, as Warren articulates it, is ambiguous. The principle, according to Green, admits of two possible readings, each of which she finds flawed. Similarly, Andrews claims that the principle is fundamentally inadequate because it cannot distinguish cases of oppressive domination from cases of nonoppressive domination. In this paper, I elucidate Warren's views and defend her against these and other criticisms put forward by Green and Andrews. I show that Warren's account of "the logic of domination" successfully illuminates important conceptual features of oppression. (EE)

Goff-Yates, Amy Lee, Beasts of Burden: Women, Animals, and Oppression, Ph.D., 1999, Department of Philosophy, Women's Studies, University of Kentucky, Ecofeminists maintain that the oppression of nature, and specifically animals, is connected to the oppression of women. I clarify this claim and argue that it is reasonable. Ecofeminists often describe the connection as conceptual. I distinguish material and formal conceptual connections. I defend the views of two influential ecofeminists who find a conceptual connection. I then offer an analysis of the concept of oppression which elucidates both the conceptual and cultural features. Oppression is a wrongful institutionalized hierarchy wherein the members of a subordinate group suffer ultimately for the benefit of persons in a dominant group. A dominant cultural ideology maintains and attempts to justify this unjust social arrangement. The oppression of women and the oppression of animals are conceptually connected because the ideologies that inform their oppressions share important and necessary features.

I argue that it makes sense to ascribe oppression to the condition of animals today because both the conceptual and cultural features of oppression apply. It is reasonable to describe animals as oppressed and given that the oppressions of women and animals are connected by a common structure of oppressive ideology, the treatment of animals is a feminist issue. The advisor was Joan C. Callahan. (v.13,#4)

Goldemberg, José, "What is the Role of Science in Developing Countries?" Science 279(1998):1140-1141. Developing countries should not expect to follow the research model that led to the scientific enterprise of the United States and elsewhere. Many scientists from developing countries, trained in the United States and Europe, returned to their own nations and tried to imitate what was being done in developing countries. India, for example, had a nuclear research program, which failed, and was largely irrelevant to the needs of India. Developing countries need a science that is relevant to their local circumstances and needs, which includes appropriate technology for sustainable development. Goldemberg is at the University of Sao Paulo, Brazil. (v9,#1)

Goldfarb, Theodore, ed. Taking Sides: Clashing Views on Environmental Issues. Reviewed in Environmental Ethics 8(1986):89-90.

Goldfarb, Theodore D., eds., Taking Sides: Clashing Views on Controversial Environmental Issues, 4th edition (Guilford, CT: The Dushkin Publishing Group, 1991). \$ 10.95 softcover. A new edition of an introductory reader that is being regularly updated. About half of the thirty-six selections are new. The book is cast in a yes/no debate format around 18 issues, e.g. "Does Wilderness Have Intrinsic Value?" "Is Brazil Serious about Preserving its Environment?" "Does Global Warming Require Immediate Action?", and authors, who often originally wrote in somewhat different contexts, are chosen to say yes or no. All the readings are at popular level. This can be a good book to wake up sleepy freshmen; there is an instructor's manual with test questions. But it tends to be noisy and the debate formate is not always the best for serious analysis of these questions in more advanced courses. Goldfarb is an environmental chemist at the State University of New York at Stony Brook. (v2,#1)

Goldfarb, Theodore D., ed., Taking Sides: Clashing Views on Controversial Environmental Issues. 5th edition. Guilford, CT: Dushkin Publishing Group, 1993. Paper. 372 pages. As before, in debate format: somebody argues yes; somebody argues no. New issues are: Did the United Nations Summit produce useful results? Will the "greening" of multinational corporations lead to environmental improvements? Should energy policy focus on reducing the use of fossil fuels? Will environmental degradation be a feature of international conflicts in the future? The format gets interest going, but, if not carefully used, can generate as much heat as light. Goldfarb is an environmental chemist at the State University of New York at Stony Brook. (v4,#4)

Goldin, Owen, and Kilroe, Patricia, eds., Human Life and the Natural World: Readings in the History of

Western Philosophy. Peterborough, Ont.: Broadview Press, 1997. (Broadview Press, P. O. Box 1243, Peterborough, Ont. K9J 7H5, Canada; 3576 California Road, Orchard Park, NY 14127 USA) With distributors in the U.S., U.K., and Australia. Twenty-seven readings from classical philosophers or theologians (sometimes literary figures or scientists), from Xenophon, Plato, Aristotle, through Thomas Aquinas, Francis of Assisi, René Descartes, to John Stuart Mill, Friedrich Engels, and Ralph Waldo Emerson. "Although the environmental problems that have rekindled interest in these issues have only recently taken center stage in Western intellectual and political discourse, the general issues to which philosophical reflection on these issues leads are not new. Indeed, they are among the oldest of philosophical questions, questions to which philosophers must continually return" (p. ix) Looking into figures of the past reveals how our own thought has been shaped, and sometimes those who see an idea first see what it most clearly amounts to. "Current debates in the field of environmental philosophy contain echoes, developments, and distortions of [these classical] positions. In order to better understand the roots of these critical debates, we must turn to the study of their historical sources" (p. xix). Goldin is in philosophy at Marquette University. Kilroe is in anthropology and linguistics at the University of Wisconsin-Milwaukee. (v8,#2)

Goldin, Owen, "Porphyry, Nature, and Community," History of Philosophy Quarterly 18 (2001): 353-371. Porphyry (232-304 A.D.) was a student of Plotinus. An analysis of the main argument of De Abstinencia 3 to the effect that animals are ethical subjects, since they are rational and obligations of justice hold in regard to all rational beings. The argument does not follow from Porphyry's own theory of justice, but is meant to show that ethical obligations to animals follow from the principles of the Stoics, who ground their theory of justice on an ethic of community. The author compares Porphyry's argument with Callicott's environmental ethic of community. Goldin is in philosophy at Marquette University. (v.13,#1)

Goldman, Michael, *Imperial Nature: The World Bank and Struggles for Social Justice in the Age of Globalization*. New Haven: Yale University Press. The World Bank is part of a conspiracy to impose on the world a "green neoliberalism" that enriches the global North at the expense of poor in the Third World. This process has its roots in colonialism and its goal is the establishment of power relationships similar to those of the colonial past. The changes brought about by the World Bank do benefit some people more than others. Some poor people have received schooling, gained access to potable water and electricity, experienced improved productivity, and gained better access to markets along newly constructed roads. But in many other cases people are forced to move, their primary livelihood destroyed or new goods and services threaten existing social and cultural norms. Goldman is in sociology, University of Minnesota.

Goldman, Michael, "'Customs in common': The Epistemic World of the Commons Scholars," Theory and Society 26(1997):1-37. Despite the fact that the famous model of natural resource use espoused by biologist Garrett Hardin, the "tragedy of the commons," has been thoroughly debunked by social scientists of most stripes, the model's assumptions--e.g. that selfish individuals using a common pool resource will overconsume to the detriment of all--have not only survived but fruitfully multiplied, as if driven by higher laws of natural selection. Its seeds have sprouted, for example, in works of natural scientists who apply biology's behavioral laws to complex social realities. It thrives deep in the soul of most commons theorists, even those fervently opposed to Hardin's model, who ply their trade by identifying, protecting, managing, saving, developing, and making efficient commons throughout the world. This commons-tragedy discourse has also shaped the thinking on the new "global commons," led by academicians and policymakers striving to direct supranational decision-making on the gray areas of global real estate: the earth's ozone, deep seas, "biodiverse" reserves (e.g. the Amazon), the North and South poles, the air waves, and so on. In other words, an old, dubious framework once applied to questions of local commons (i.e how to stop self-interested shepherds from destroying community pastures), is now being applied to saving our global commons.

In fact, the commons metaphor is an important icon of the "development world." It is being used as a hidden and not-so-hidden institution of domination and imperialism in North-South relations, in an effort to restructure the commons, to "privatize," "develop," "make more efficient," "valorize," "get the price right," in the service of crisis-ridden capitalisms. This does not stop destructive practices; it rather normalizes and further institutionalizes them, putting commoners throughout the world at even greater risk. Goldman is at the University of California, Berkeley. (v.10,#1)

Frank Golley introduces the presentations at the 1996 forum titled "Valuing the American Environment" sponsored by the Humanities Center of the University of Georgia. Golley is in ecology at the University of Georgia. (E&E)

Golley, Frank B. "Deep Ecology from the Perspective of Environmental Science." Environmental Ethics 9(1987):45-55. Deep ecology is examined from the perspective of scientific ecology. Two norms, self-realization and biocentric equality, are considered central to deep ecology, and are explored in brief. Concepts of scientific ecology that seem to form a bridge to these norms are ecological hierarchical organization, the exchange of energy, material and information, and the development of species within ecosystems and the biosphere. While semantic problems exist, conceptually it appears that deep ecology norms can be interpreted through scientific ecology. Golley is at the Institute of Ecology, University of Georgia, Athens, GA. Gomez-Pompa, A, "The Role of Biodiversity Scientists in a Troubled World", BioScience 54 (no.3, 2004): 217-225(9). Biotic resources are under all kinds of old and new threats. Ecosystem transformation in many areas of high biodiversity has not diminished, in spite of national and international meetings, agreements, and discussions. The main reasons to protect these resources are that little information is available on those we know exist and that the great majority of resources are yet to be discovered. One argument used to convince the general public and governments of the need to preserve biological

resources is that there are many potential uses of unknown plants, animals, or microorganisms: New medicines, foods, chemicals, and genes are there to be discovered. Unfortunately, this argument has been overused and, as a result, has created unrealistic expectations of great riches and spurred stringent legal measures to restrict biodiversity research. The limits placed on biodiversity research and on access to biological resources are becoming a major obstacle to scientific discovery. Major projects have been suspended following unjustified criticisms. In this article, I discuss possible explanations for this problem and present some possible solutions.

GomezPompa (Gómez-Pompa), Arturo and Andrea Kaus, "Taming the Wilderness Myth," BioScience 42 (no. 4, April 1992):271-279. "Environmental policy and education are currently based on Western beliefs about nature rather than on reality." "The perspectives of the rural populations are missing in our concept of conservation. Many environmental education programs are strongly biased by elitist urban perceptions of the urban world. This approach is incomplete and insufficient to deal with the complex context of conservation efforts and home and abroad. It neglects the perceptions and experience of the rural populations, the people most closely linked to the land, who have a firsthand understanding of their surrounding natural environment as teacher and provider." "Until we understand that the tropical forests are 'both artifact and habitat,' we will be advocating policies for a mythical pristine environment that exists only in our imagination." The authors argue that, especially in Mexico and the Amazon, the pre-European landscape was already managed intensively by the indigenous peoples and that there was no undisturbed wilderness. Gómez-Pompa is professor of botany at the University of California Consortium on Mexico and Kaus is a graduate student in anthropology at the University of California, Riverside. (v3,#3)

Gonyou, H.W., "Animal Welfare: Definitions and Assessment", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. Several types of definitions and means of assessing welfare are discussed in an attempt to reconcile differences which may be counter-productive in addressing welfare issues. Various groups should use similar terminology and it is suggested that well-being be used in the context of the current state of the animal, while welfare refer to a more general concept including

past, present and future implications for the animal's well-being. Legal, public and technical definitions of welfare serve different purposes and will necessarily differ. All of these definitions are interdependent and are affected by, and affect, each other. It is suggested that all definitions should attempt to reflect the animals' perspective on their own welfare. Although the ideal means of assessing welfare may lie in determining animals' mental experiences, our ability to do this is limited at this time. A more practical approach is to assess several behavioural, physiological and pathological variables. Reliance on a specific variable or a "cut-off" point may be appropriate in a legal definition of welfare, but should be avoided in scientific studies. The study of animal welfare should not focus only on assessing well-being or the effects of poor welfare, but should also determine behavioural, physiological and pathological factors which predispose animals to environmental stressors. Only then can we focus on developing improved management systems rather than eliminating poor ones. Gonyou is in the Department of Animal Sciences, University of Illinois, 1207 W. Good Housekeeping, April 1991, contains a considerable section on saving the Earth, including a message from President Bush, articles by Michael Oppenheimer, Gregg Easterbrook, Norman Myers, Stephen H. Schneider, Amory Lovins, Bill McKibben, and others on global warming, acid rain, landfills, pollution, diapers, wildlife, wetlands, energy, and other topics. (v2,#1)

Goodall, Chris. *How to Live a Low-Carbon Life*. London: Earthscan, 2007. Goodall discusses how to reduce your carbon footprint. See also the website: <<http://lowcarbonlife.net>>.

Goodall, Jane, Through a window: My thirty years with the chimpanzees of Gombe. Boston: Houghton Mifflin Company, 1990.

Goodall, Jane and Bekoff, Marc, The Ten Trusts: What We Must Do to Care for the Animals We Love. San Francisco: HarperSanFrancisco, 2002. In alternating narratives, distinguished by typeface, Goodall and Bekoff outline a 10-point course. The trusts include the simple, but vital, call to "rejoice that we are part of the animal kingdom" and to "respect all life"; they urge us to be willing to learn what animals have to teach, to be good stewards of the whole earth, to teach children to respect and to love nature and to have "the courage of our convictions".

Goodall: "I have seen that appeal for help in the eyes of so many suffering creatures. An orphan chimp tied up for sale in an African market; an adult male [chimp] looking out from his five-by-five-foot sterile cell in a medical research laboratory; a dog, emaciated and starving, abandoned by her owner in the beach in Dar es Salaam; an elephant chained to a cement floor by one front and one hind foot. I have seen it in the eyes of street children, and those who have seen their families killed in the 'ethnic cleansing' in Burundi."

Bekoff: "As big-brained, omnipresent, powerful and supposedly omniscient animals, we are the most powerful beings on Earth. We really are that powerful, and with that might are inextricably tied innumerable staggering responsibilities to be ethical human beings. We can be no less." Goodall is famed for her researches on chimpanzees; Bekoff is an animal behaviorist at the University of Colorado. (v.13,#4)

Goodall, Jane, "The Power of One," Time, August 26, 2002, p. A62. One-page essay in a Time theme section on the coming Green Century. "I feel deep shame when I look into the eyes of my grandchildren and think how much damage has been done to Planet Earth since I was their age. Each of us must work as hard as we can now to heal the hurts and save what is left."

Goodall, Jane, and Berman, Philip, Reason for Hope: A Spiritual Journey. Warner Books, 1999. Jane Goodall's return to religious faith, facing the realities of environmental destruction, animal abuse, and genocide, especially as she has known them in Africa. Her studies with the chimpanzees have enhanced, not ended her belief in God. She shares a spiritual epiphany during a visit to Auschwitz, and an experience before the rose window in the Cathedral of Notre Dame, hoping for spiritual power to overcome the evils in the world. She recalls bravery in the face of chimpanzee imprisonment in medical laboratories. There is a chapter on individuals, corporations, and countries that are doing the right thing. "Together we must reestablish our connections with the natural world and with the Spiritual Power that is around us. And then we can move, triumphantly, joyously, into the final stage of human evolution--spiritual evolution" (p. 267). Wendy Wasserstein, a Pulitzer prize-winning playwright, calls Goodall, "one of the ten most influential women ever." (v10,#4)

Goodell, Jeff. *Big Coal: The Dirty Secret Behind America's Energy Future*. New York: Houghton Mifflin, 2006. Abundant, cheap coal provides about half the electricity Americans use, and 120 new coal-fired plants are currently in development. If this rush is not halted, the chances "of stabilizing the climate are virtually zero." China is also "the world's premier coal junkie."

Goodenough, Merry. "Public Participation in a State-Assumed Wetlands Permit Program: The Michigan Example." Journal of Environmental Law and Litigation 10, no.2 (1995): 221. (v7, #3)

Goodenough Ursula, "At Home with Ecology," Science and Spirit 11(no. 4, November/December 2000):18-19. The sacred depths of nature emerge from the common ground of subjective, cultural and natural dwellings. Might this be religion? Life is a coral reef. We each leave behind the best, the strongest deposit we can. But what's important is the reef. The metaphor goes to the heart of ecology. Goodenough is in biology at Washington University. (v.11,#4)

Goodenough, Ursula W., "The Religious Dimensions of the Biological Narrative," Zygon 29(1994):603-618. Three concepts--meaning, valuation, and purpose--are central to the entire biological enterprise, and the continuation of this enterprise is a sacred religious trust. Goodenough is a cell/molecular biologist at Washington University, St. Louis. (v5,#4)

Goodenough, Ursula, The Sacred Depths of Nature. New York: Oxford University Press, 1998. 160 pages. A modern understanding of biology can be reconciled with our timeless spiritual yearnings for reverence and continuity. Evolution, sexuality, emotions, death--these can be seen in ways that scientists and non-scientists alike come to appreciate that the origins of life and the universe are no less meaningful because of our increasingly scientific understanding of them. Goodenough is in biology at Washington University, St. Louis. (v.9,#4)

Goodin, David K. "Schweitzer Reconsidered: The Applicability of Reverence for Life as Environmental Philosophy." *Environmental Ethics* 29(2007):403-421. As the last great philosopher of the will, Albert Schweitzer rejected the radical individualism of Nietzsche and the pessimistic-mystical detachment of Schopenhauer, and instead sought to create a true social ethic. Schweitzer's particular contribution was to

move further than Nietzsche to reconcile philosophy with natural science while simultaneously preserving and transforming the sense of mysticism and higher world-order principles from Schopenhauer. He joined this new cosmology to the virtue ethics of Aristotle, and recovered one key element of his ontology of becoming to transcend the Humean "is/ought" gap for ethics. The result is a philosophy that is as much biographical of Schweitzer himself as it is systematic. This result is both the strength and greatest weakness of his reverence-for-life ethic. It is tailor-made for contemporary environmental ethics: it has applications in many strands of environmental thought, including deep ecology, ecofeminism, and ecotheology, and may attract considerable interest from environmental movements that seek to cultivate deep personal conviction. (EE)

Goodin, Robert E., "Property Rights and Preservationist Duties." Pages 192-221 in Oddie, Graham and Perrett, Roy W., eds., Justice, Ethics and New Zealand Society. Auckland, New Zealand: Oxford University Press, 1992. Revised from Inquiry 33 (1990):401-432. Property rights are often thought to conflict with preservationist duties. But that is so only if property rights entail the right to destroy. Property rights, properly analyzed, are fully compatible with (and might even entail) preservationist duties. Goodin is in philosophy in the Research School of Social Sciences, Australian National University, Canberra.

Goodin, Robert, "A Green Theory of Value." Pages 61-86 in Mulvaney, D. J., ed., The Humanities and the Australian Environment. Canberra: Australian Academy of the Humanities, 1991.

Goodin, Robert E., Green Political Theory. Cambridge: Polity Press, 1992. 240 pages. Paper. Goodin argues that two pairs of ideas are wrongly thought by green thinkers to belong together. First is the combination of recommendations on public policy and the adoption of green personal lifestyles. These are only connected one way, Goodin says. Green lifestyle recommendations imply, but are not implied by, green policy recommendations. Second, there is the connection between green values--the recognition of value in a natural context independent of human life--and green political agency, typically committed to democratic, devolved and participatory processes. Again, Goodin argues, these are not as tightly connected as many green thinkers suppose. Green value theory has priority over the ideals of agency put about by many greens. Moreover the green theory of agency cannot be derived from the green theory of value: "to advocate democracy is to advocate procedures, to advocate environmentalism is to advocate substantive outcomes: what guarantee can we have that the former procedures will yield the latter sort of outcomes? More generally, how can we guarantee that localized, or nonviolent, action will always best protect the global environment?" Absent a satisfactory answer to these questions, Goodin urges that it is the theory of value, not of political agency, that truly defines the core of the green political agenda. Goodin is Professor of Philosophy at the Research School of the Social Sciences, Australian National University and edits the new Journal of Political Philosophy. (Thanks to Andrew Brennan.) Achterberg, Wouter, Review of Goodin, Robert, Green Political Theory. Environmental Values 3(1994):79-80. (v4,#4)

Goodin, Robert E.; Pateman, Carole; and Pateman, Roy. "Simian Sovereignty." Draft paper. Sovereignty never amounted to much, morally speaking. Now it is not even what little it used to be. By the standards now prevailing, the great apes are as deserving of something like "sovereign prerogatives"--the right to organize and control their own collective lives within a patch of land protected by international law from foreign incursion--as are other serious claimants to sovereign status in the world today. The great apes are, in all the ways that matter, just as deserving of the protection of the international community as any other of the territorially-based communities that we dub "nation-states." Goodin is in philosophy and political theory at the Research School of Social Sciences, Australian National University, Canberra. Carole Pateman and Roy Pateman are in political science at UCLA. Goodin, Robert E., ed., The Politics of the Environment. Aldershot, Hants, UK; and, Brookfield, VT: Edward Elgar, 1994. 599 pages. Not cheap: \$ 140.00. Designed as a reference collection. Part I. Environmental Ethics, ten classical articles reprinted, from Passmore, Stone, Feinberg, Tribe, Sagoff, Hill, Elliot, Naess, Donald Regan, Plumwood. Part II. Environmental Action, 24 articles reprinted. The final article is: Goodin, Robert E., "International Ethics and the Environmental Crisis," reprinted from Ethics and International Affairs, 4(1990):91-105. (v.9,#4)

Goodland, Robert and Herman Daly, "Poverty Alleviation Is Essential for Environmental Sustainability," The World Bank Environmental Department, Divisional Working Paper 1993-42. More than one-fifth of humanity lives in poverty; nearly two-thirds of humanity subsist on less than \$ 2 per day. The numbers of poor are increasing. The world is hurtling away from environmental sustainability. Five views are contrasted on how to alleviate poverty: the trickle-down theory, that the North must consume more to expand markets for Southern raw materials. The elitist choice, that the rich foster poverty because it creates low wage labor. Capital seeks cheap labor. Anthropocentric, people-centered environmentalism, places humans at the center of the cosmos, the rest is derivative. The biocentric view claims that the living ecosystem is central; humans are part of it. We have a duty to conserve the whole. Redistributive justice asserts that poverty can be alleviated directly by improving access of the poor to shelter, clothing, food, education, and security. The authors are with the World Bank. Copies from World Bank, Environment Department, Washington, DC 20433. Fax 202/477-0565. (v4,#2)

Goodland, Robert, "Ethical Priorities in Environmentally Sustainable Energy Systems: The Case of Tropical Hydropower," a paper given at a conference in Montreal, Quebec, in May, "Energy Needs in the Year 2000 and Beyond: Ethical and Environmental Perspectives." Includes six ethical-environmental criteria. Two of them: "Environmental impact is roughly proportional to area inundated. Therefore, the proposed dam must have the highest feasible ratio of power production per area inundated. If not, then the project has a higher than necessary environmental impact, which could be unethical." "The proposed site and surroundings have no centers of species endemism, rich biodiversity or other special features. If not, the ethics of extinction of species have been disregarded." (v4,#2)

Goodland, Robert, "South Africa: Environmental Sustainability and the Empowerment of Women," Impact Assessment, a special publication of this journal, June 1995, from a conference of the International Association of Impact Assessment, Durban, South Africa. Impact Assessment is based in the Department of Resource Development, Michigan State University. Copies from RJA Goodland, Environment Department, The World Bank, Washington, DC 20433. Fax 202/477-0565. In common with most nations, South African Society also is hurtling away from environmental sustainability at present, largely because of widespread inequity, poverty, inadequate consumption per capita, and rapid population growth which undermines future consumption per capita. This situation is reminiscent of some U. S. data on black/white ratios too. South Africa's black 76 percent majority earns only 36 percent of the national income, whereas the white 13 percent minority earn 54% of the national income (with the colored population in between). This strains environmental sources of raw materials, as well as environmental sinks for assimilating wastes. Environmentally sustainability is quintessentially a social concern. Environmental sustainability needs social sustainability--the social scaffolding of people's organizations that empower self-control and self-policing in people's management of natural resources. The main element of social responsibility germane here is empowerment of women. Includes a good bibliography. (v7,#1)

Goodland, Robert, Herman E. Daly, and Salah El Serafy, eds. Population, Technology, and Lifestyle. Washington: Island Press, 1992. Ten articles: samples: Daly: "From Empty-world economics to Full-world economics: Recognizing an Historical Turning Point in Economic Development"; Goodland, "The Case that the World Has Reached Limits"; Robert Costanza, "The Ecological Economics of Sustainability: Investing in Natural Capital"; Jan Tinbergen and Roeffie Hueting, "GNP and Market

prices: Wrong Signals for Sustainable Economic Success that Mask Environmental Destruction." The editors, who are philosophically quite sophisticated, are with the World Bank. (v4,#1)

Goodland, Robert, "The Concept of Environmental Sustainability," Annual Review of Ecology and Systematics 26(1995)1-24. A review of the current debate about environmental sustainability, and related growth, limits, scale, and substitutability. The paths leading to environmental sustainability in each country or sector will differ, but the goals remain constant. Conceptualizing this is far from an academic exercise. Ensuring, within two human generations, that as many as 10 billion people are decently fed and housed without damaging the environment on which we all depend represents a monumental challenge. Goodland is with the World Bank. (v7,#1)

Goodman, Jordan and Walsh, Vivien, The Story of Taxol: Nature and Politics. New York: Cambridge University Press, 2001. 296 pp. \$ 28.00. Taxol is an extract from yew trees, from which is derived paclitaxel, the single most prescribed anti-tumor agent. Development of the drug took from 1966 until approval in 1992, amidst controversy. The Pacific yew (*Taxus brevifolia*) is found, infrequently, in Pacific Northwest old growth forests, home to the spotted owl. Environmental groups opposed destruction of the forests for the yew bark (partially at a time when benefits of taxol were uncertain); bark collectors legal and illegal became involved; media loved the controversy. Bristol-Myers Squibb developed a semi-synthesis that uses the needles, not the bark, and therefore does not require destroying the tree.

Reviewed by McGuire, William P., "Developments from a Beneficial Bark," Science 292(2001):1073-1074. McGuire adds that when Bristol-Myers Squibb's exclusive rights to paclitaxel expired, it came to light that the company had used patents to block the entry of several generic and less expensive alternatives, thereby reducing the availability of the drug to cancer patients who needed it. Goodman, Russell. "Taoism and Ecology." Environmental Ethics 2(1980):73-80. Although they were in part otherworldly mystics, the Taoists of ancient China were also keen observers of nature; in fact, they were important early Chinese scientists. I apply Taoist principles to some current ecological questions. The principles surveyed include reversion, the constancy of cyclical change, wu wei ("actionless activity"), and the procurement of power by abandoning the attempt to "take" it. On the basis of these principles, I argue that Taoists would have favored such contemporary options as passive solar energy and organic farming. Goodman is in the department of philosophy, University of New Mexico, Albuquerque, NM. (China)

Goodman, Steven M., Patterson, Bruce D., eds. Natural Change and Human Impact in Madagascar. Washington, D.C.: Smithsonian Institution Press, 1997. 434 pp. \$75 cloth, \$35 paper. Describing the past dynamism of island environments and analyzing the causes of the disappearance of many of the island's endemic species, the contributors also assess future prospects for preserving Madagascar's remaining natural areas while sustaining a healthy human economy. Goodwin, Neva R., Ackerman, Frank, Kiron, David. The Consumer Society. Washington, D.C.: Island Press, 1997. 385pp. Many contributors, an anthology of rather brief summaries of the most important and influential writings on the economic, environmental, ethical, and social implications of a consumer society and consumer lifestyles. The collection should interest anyone concerned with the deeper implication of consumerism. Foreword by John Kenneth Galbraith. Sample articles: David A. Crocker, "Consumption, Well-Being, and Virtue"; Alan Durning, "Asking How Much Is Enough"; Mark Sagoff,

"The Allocation and Distribution of Resources"; John Maynard Keynes, "Economic Possibilities for our Grandchildren." And many more. The editors are at the Global Development and Environment Institute, Tufts University, Medford, MS.

Goodwin, Neva. "An Overview of Climate Change: What does it mean for our way of life? What is the best future we can hope for?" Working Paper No. 08-01. Global Development and Environment Institute, Tufts University, 2008. Abstract: This paper starts with the question of whether climate change will require a significant reduction of consumption among the richer people in the world, and ends with the most optimistic picture the author can conjure up, of the world in the year 2075. That hopeful picture is of a world in which inequalities among and within nations have been substantially reduced. The challenges and adjustments confronting humanity in the coming decades provide an opportunity that could be used to mitigate climate change in ways that can improve the circumstances of the poor. Ecological reasons to reduce throughput of energy and materials in economic systems urge the abandonment of high-consumption life-styles. The 21st century will be an era of many losses, but it is conceivable that societies will successfully make the transition from goals of economic growth, as understood in the 20th century, to goals of maintaining and increasing sustainable well-being. Goodwin is an economist and is the co-director of the Global Development and Environment Institute. The paper can be downloaded as a pdf at:

Gorman, James, "Yosemite and the Invention of Wilderness," New York Times, Sept. 2, 2003, Section F (Science), page 1. Rebecca Solnit is a writer (a dozen books) and a hiker (one book is Wanderlust: A History of Walking) who has lately been following the trail of the idea of wilderness. She believes that the American idea of pristine wilderness is "a powerful, profoundly mistaken fantasy." Much of this fantasy arise in Yosemite where most of the early photographers did not include people, but Yosemite had people in it when the Europeans arrived, native Americans were there. Soldiers "un-peopled" it. These people had, for instance, been setting forest fires. Well, now that residents are gone, and especially in the parts of the High Sierra that even the native Americans mostly just visited, it would be interesting to hike with her through her mythological wilderness. Gorman, Michael E., Mehalik, Matthew M., Werhane, Patricia H. Ethical And Environmental Challenges to Engineering: A Casebook in Engineering and Environmental Ethics. Upper Saddle River, New Jersey: Prentice Hall, 2000. 256 pp. The first casebook designed specifically for engineering and environmental ethics, this text features multi-faceted, real-life cases of design and managerial dilemmas in a variety of settings. Background readings that illustrate how one can integrate ethical and environmental challenges into engineering decisions are incorporated throughout. It includes various cases that can be adapted to a variety of classroom settings, including cases on engineering design, environmental ethics, cultural diversity, management, engineering dilemmas. It presents real-life events showing engineering students certain situations they will encounter on the job. (v10,#4)

Gorman, Paul, "Awakenings: Spiritual Perspectives on Conservation," Nature Conservancy Magazine 53 (no. 1, Spring, 2003):20-29. With 12 "personal faith" interviews of persons motivated by their religious

faith to conservation. Cover story in this issue.

Gorringe, T. J., A Theology of the Built Environment: Justice, Empowerment, Redemption. Cambridge: Cambridge University Press, 2002. The divine grounding of our built environment. Ownership of land, urban and rural housing, the built environment in terms of community and art. Two concluding chapters set this built environment within the environmental crisis. Gorringe is at the University of Exeter. (v 14, #3)

Gorte, Ross W., "Multiple Use in the National Forests: Rise and Fall or Evolution?" Journal of Forestry 97 (no. 10, November, 1999):19-23. Nobody much likes "multiple use" any more; "ecosystem management" has replaced it. But is this multiple use rejected or resurrected under a more fashionable name? Different commentators see it different ways. "Multiple use" seemed unable to resolve conflicts when they grew intense. "Ecosystem management" seems fuzzy, an uncertain replacement, although "ecosystem management" in some form is likely to be official management policy for the foreseeable future. Gorte is a natural resource economics and policy specialist with the U.S. Library of Congress. (v.12,#3)

Gorte, Ross W. "Multiple Use in the National Forests: Rise and Fall or Evolution?" Journal of Forestry 97(No. 10, Oct. 1999):19- . Is multiple use dead? Or has it simply morphed into ecosystem management? A look at the management history of the national forests provides some clues. (v10,#4)

Chaston is director of studies in the Faculty of Business at the University of Plymouth. (P&G)

Gorton, Slade, Kays, Juli. "Legislative History of the Timber and Salvage Amendments Enacted in the 104th Congress: A Small Victory for Timber Communities in the Pacific Northwest." Environmental Law 26(1996):641. U.S. Senator Slade Gorton and his natural resources legislative assistant Juli Kays, discuss the purpose and scope of the salvage logging rider. Responding to Professor Axline's criticisms of the salvage logging rider, they explain that its purposes are to restore forest health and jobs in timber communities. (v7,#2)

Goetz, André, Capitalism, Socialism, Ecology. New York: Routledge, 1994. 240 pages. Paper, \$ 19.95. Translated by Chris Turner. Technological developments have transformed the nature of work and the structure of the workforce, and we face grave risks posed by a dual society with a hyperactive minority of full-time workers confronting a majority who are, at best, precariously employed. There is a key social conflict in Western societies in terms of the distribution of work and the form and content of nonworking time, all affecting the relationship of humans to the natural world. Goss, M.J. and Barry, D.A.J. "Groundwater Quality: Responsible Agriculture and Public Perceptions." Journal of Agricultural and Environmental Ethics 8(1995):52-64. The chief sources of groundwater contamination on farms come from point sources and diffuse sources. Possible point sources are feedlots, poorly-sited manure piles, septic sewage-treatment systems - all of which can release nitrate, phosphates and bacteria - and sites of chemical spills. Diffuse sources are typified by excess fertilizer leaching from a number of arable fields. The basis of quality standards for drinking-water is discussed in relation to common contaminants present on farms. Samples of drinking-water were collected in 1991-1992 from wells on about 1,200 farms in order to study the quality of rural groundwater in Ontario. Analysis showed that approximately one third of wells were contaminated with bacteria, 14% were contaminated with nitrate, two wells were contaminated with pesticide, but 40% were considered unsafe because of the presence of at least one contaminant. These values were similar to those reported for similar regions in the U.S. There was no significant effect of agricultural practice on the proportion of contaminated samples. One response of Ontario's farmers to information on water quality has been to initiate their own program, the "Environmental Farm Plan," which has 23 modules by which the risk of environmental contamination can be assessed. Government policies for agriculture can be expected to influence farming practices. However, the literature suggests that the consequences of policies aimed at reducing environmental contamination are poorly understood, not least because the instruments used for implementation can have widely differing impacts. The need for discussions on the ethics surrounding the relationship between food producers and consumers with regard to environmental contamination is identified. (JAEE)

Gosseries, Axel, "L'éthique environnementale aujourd'hui (Environmental Ethics Today)," Revue Philosophique de Louvain 96(no. 3, 1998):395-426. In French. An overview of contemporary debates in environmental ethics. In the first section: a distinction between environmental protection, nature conservation, and biodiversity conservation. These three policies are autonomous and the last two are difficult to justify from an ethical point of view. Second section: interspecific justice, with a dilemma of the anti-speciesist. Third section: intergenerational justice. Final section: international justice, various criteria of allocation for greenhouse gasses emissions reduction.

"The article does a very good job, a very solid analysis. The author approaches environmental ethics in terms of: (A) its basic tenets and (B) the dilemmas/controversies stemming from these tenets. There are three basic tenets: (1) the protection of the environment, (2) the need to include creatures other than humans within our ethic, (3) the need to consider intergenerational and international factors. Each of

these is divided into sub-tenets. The problems stemming from each are briefly explored. In no way does the author attempt to resolve the multiplicity of problems described. Indeed, there is doubt that any general conceptual scheme can contain and/or coordinate them." (Thanks to Pete A. Y. Gunter.)

Both authors are in Urban Planning at UCLA. (v2,#1)

Gottlieb, Robert, "Beyond NEPA and Earth Day: Reconstructing the Past and Envisioning a Future for Environmentalism," Environmental History Review 19 (no. 4, 1995):1-14. Environmentalism, developing out of the past, needs to be reconstructed to see how it is embedded in the social, or the urban and industrial sphere, connecting natural environments, human environments, and daily life. U. S. environmentalism, in its more than 100 year history, needs to be seen as a response to and indeed an extension of the changes to landscape and society wrought by urban and industrial forces. Environmentalism has been powerfully influenced and ultimately framed by these urban and industrial forces. There are today essential two broad categories of environmental activity, a mainstream and an alternative environmentalism. Mainstream environmentalism remains focused on policy and power, on accomplishing change by helping construct, influence, and watchdog the environmental policy system. Alternative environmentalists focus on people and on place. They accomplish change by being ornery, argumentative, mistrustful, and by mobilizing their base, often against one or another dimension of that same environmental policy system. Gottlieb is at the University of California, Los Angeles. (v7,#2)

Gottlieb, Robert, Forcing the Spring: The Transformation of the American Environmental Movement. Washington: Island Press, 1993. 413 pages. Hardbound, \$ 27.50. Gottlieb thinks that environmentalism began as the conservation of wild nature but has been increasingly broadened and transformed to include industries, cities, agriculture, pollution issues, public health issues. He wants to shift the debate from one focused exclusively on the protection and management of the natural world to a wider discussion of American social development in harmony with nature. Is the environmental movement capable of transcending its origins and changing the very fabric of American social life? Gottlieb teaches environmental policy in the Urban Planning Program at UCLA. (v4,#2)

Gottlieb, Robert. *Reinventing Los Angeles: Nature and Community in the Global City*, Cambridge, MA: The MIT Press, 2007. Using history, theory, and personal narrative, Gottlieb discusses the emergence of Los Angeles as a global city and its continuing evolution. He examines how immigration and economic globalization intersect with changes in the politics of land use, transportation, and water by discussing grassroots accounts and activists responses to re-envision the Los Angeles River as a natural resource, Arroyofest, the closing of the Pasadena Freeway for a day of bike riding and walking, and immigrants' initiatives to create urban gardens and connect with their countries of origin.

Gottlieb, Roger S., A Spirituality of Resistance: Finding a Peaceful Heart and Protecting the Earth. Lanham, MD: Rowman and Littlefield, 2003. A study of how people get caught up in social forces that lead to genocide, as happened in the Holocaust, and how they also are caught up in social forces that are leading to ecocide, impending in the environmental crisis. Our celebration of nature can be authentic only if it exists alongside resistance; what we do matters as much as what we feel. Large, impersonal bureaucracies can grow irrational, and this cries out for resistance. Such anger is born of love, and Gottlieb's intensity of resolution, coupled with forceful argument speaking the truth to power, is all too rare today, and urgently needed. Gottlieb is at Worcester Polytechnic University. An earlier version of this appeared in 1999, published by Crossroad Publishing Co. (v 14, #3)

Gottlieb, Roger S., A Spirituality of Resistance: Finding a Peaceful Heart and Protecting the Earth. New York: Crossroad Publishing Co., 1999. 195 pages. \$ 25.00. Chapter 4: "A Sleepless Ethicist and Some of His Acquaintances, Including the Monoculturalist, the Poetic Naturalist, and the Very Famous Biologist." Chapter 5. "Finding a Peaceful Heart and Protecting the Earth. "What can we hope for? In his own lifetime the Ethicist has seen a worldwide movement improve the condition of women throughout the world. He knows that his individual actions are a minuscule part of a similarly vast effort to reorient society toward environmental sanity. He hopes that as this effort unfolds it will lead us to be more unassuming both in our self-assessment as a species and our desires for a 'better life'--even though achieving this self-assessment might require a difficult and contentious social transformation. We may

learn that a truly 'higher standard of living' cannot be achieved until we curtail our current environmental aggression, and that no amount of toys will cure our loneliness for both natural and human community. We might learn that false expertise should not be trusted, and that a monocultured earth is very lonely; and that to love either people or the earth we need to love both" (pp. 134-135). Gottlieb is in philosophy at Worcester Polytechnic Institute, Worcester, MA. (v10,#4)

Gottlieb, Roger, "Spiritual Deep Ecology and the Left," Capitalism, Nature, and Society 6 (no. 3, 1995):1-20, 41-45. This essay attempts a reconciliation between spiritual deep ecology and neo-marxist political theory by exhibiting some of the social origins and political implications of each perspective for the other. The essay forms the basis for a symposium with responses by Robyn Eckersley, Andrew McLaughlin, John Barry, and David Pepper, and a rejoinder by Gottlieb. (v7,#2)

Gottlieb, Roger, "The Transcendence of Justice and the Justice of Transcendence: Mysticism, Deep Ecology, and Political Life," Journal of the American Academy of Religion 67(1999):149-166. The search for some wisdom that transcends the perils and pains of ordinary existence is "mysticism," at the heart of the world's religions. A danger is that this search can become merely aesthetic or serve as a spiritual by-pass of the moral and the political. In our own social setting our collective violence towards the environment has led to a return--on something approaching a mass scale--of a mysticism that takes the earth and all its life as an ultimate truth.

From the heart of the spiritual impulse and the memories of countless generations in which forest and grassland, bird and wolf and salmon were our home and family and intimate enemy, comes Deep Ecology. The Deep Ecology of which I speak here is not the version presented in the technical language of philosophical ethics, where debates about varieties of intrinsic as opposed to instrumental value take place. Rather I speak of a passionate, spiritually oriented, mystical communion with the earth and its many beings, a recognition of kinship with those beings that requires no more philosophical justification than does the connection we feel with our parents, pets, or lovers. As such, Deep Ecology is a spiritual philosophy; and the deepest experiences that animate its adherents are profoundly mystical.

Deep Ecology has been criticized by emphasizing wilderness while forgetting toxic dumps, for love of trees and lack of concern for children. These criticisms have helped move Deep Ecology towards an understanding that environmentalism needs to embrace the concerns of environmental justice: an awareness of any resistance to the unfair distribution of responsibility for and suffering from humanity's attacks on the environment. Can we really love nature if these things escape our vision?

Gottlieb teaches philosophy at Worcester Polytechnic Institute, Worcester, MA. (v.10,#1)

Gottlieb, Roger S., *A Greener Faith: Religious Environmentalism and Our Planet's Future*, Oxford University Press, 2006. In a time of darkening environmental prospects, frightening religious fundamentalism, and moribund liberalism, the remarkable and historically unprecedented rise of religious environmentalism is a profound source of hope. Theologians are recovering nature-honoring elements of traditional religions and forging bold new theologies connecting devotion to God and spiritual truth with love for God's creation and care for the Earth. And religious people throughout the world are transforming the meaning of their faiths in the face of the environmental crisis. The successes and significance of religious environmentalism are manifest in statements by leaders of virtually all the world's religions, in new and "green" prayers and rituals, and in sophisticated criticisms of modern society's economy, politics, and culture. Most important: from the Evangelical Environmental Network to the Buddhist prime minister of Mongolia, the National Council of Churches to tree-planting campaigns in Zimbabwe, religious environmentalism has become a powerful component of the world environmental movement. Stories of faith based environmentalism provide a bright picture of the faith community's capacity for caring for God's creation. The remarkable and historically unprecedented rise of religious environmentalism is a profound source of hope. Theologians are recovering nature honoring elements of traditional religions and forging bold new theologies connecting devotion to God and spiritual truth with love for God's creation and care for the Earth. Gottlieb is in Philosophy at Worcester Polytechnic Institute. Reviewed

Goudzwaard, Bob and Harry DeLange (De Lange), Beyond Poverty and Affluence. Grand Rapids, MI: Wm. B. Eerdmans, 1994. 176 pages. \$ 15. Co-published with the World Council of Churches. Today's widespread problems of poverty, unemployment, and environmental degradation are rooted in--and thus can never be resolved by--the dominant contemporary economic models of growth. The authors argue for an economy of care, or an economics of enough, with twelve concrete, feasible proposals for moving present-day society in such a direction. (v5,#3)

Goudzwaard, Bob, and Harry de Lange, Beyond Poverty and Affluence: Toward an Economy of Care. Grand Rapids, MI: William B. Eerdmans, 1994. Translated from Dutch. 160 pages. \$ 14.99. "In 1960, the richest 20% of the world's population had incomes 30 times greater than the poorest 20%. By 1990, the richest 20% were getting 60 times more." In the U.S., "at the start of the 1980's, a Chief Executive Officer made about 29 times as much as the average worker. Today that multiple is close to 100 times." More people are now homeless in the U.S. than at any time since the Great Depression. Between 1979 and 1989, when the GNP increased 25 percent, the rate of child poverty increased 21 percent. The economic view that "restoration of industrial production growth will remedy poverty, environmental degradation, and unemployment" is "thoroughly simplistic," because "like a virus that has developed a resistance or immunity to the cure, or like a pest that has developed a defense against the pesticide, these economic malaises have now become immune to the remedy of increased production growth." We should embrace an economics of enough by adopting "income and employment levels ...[with] the objectives of providing sufficient care for human subsistence needs, the quality of labor, the sustainability of agricultural and urban ecosystems, and improved development opportunities, especially for the poorest countries of the Third World." "Human well-being, both of ourselves and of others, requires first and foremost a lifestyle of restraint, not luxury." A sobering book. The authors are well known Dutch economists, Goudzwaard, a former member of the Dutch parliament, is at Free University of Amsterdam. de Lange is at University of Utrecht. (v6,#4)

Gould, Kenneth A., David N. Pellow, and Allan Schnaiberg. *The Treadmill of Production: Injustice and Unsustainability in the Global Economy*. Boulder, CO: Paradigm Publishers, 2008. The authors elaborate upon Schnaiberg’s concept of the treadmill of production: capitalist economies behave like a “treadmill of production” that continuously creates social and ecological harm through a self-reinforcing mechanism of increasing rates of production and consumption. They discuss the causes of environmental degradation, the limits of environmental protection, and how and why institutional decision makers fail to protect human well-being and the environment.

Gould, Stephen J., "The Golden Rule--A Proper Scale for Our Environmental Crisis," Natural History, September 1990. Gould's proposal for "an appropriate environmental ethic." The usual environmental ethics rests on two mistaken premises: "(1) That we live on a fragile planet now subject to permanent derailment and disruption by human intervention; (2) that humans must learn to act as stewards for this threatened world." Both premises reflect false pride. Concerning the latter premise: "We are one among millions of species, stewards of nothing. By what argument could we, arising just a geological microsecond ago, become responsible for the affairs of a world 4.5 billion years old, teeming with life that has been evolving and diversifying for at least three-quarters of that immense span? Nature does not exist for us, had no idea we were coming, and doesn't give a damn about us." Concerning the former premise: "We are virtually powerless over the earth at our planet's own geological time scale." "We can surely destroy ourselves, and take many other species with us, but we can barely dent microbial diversity and will surely not remove many millions of species of insects and mites. On geological scales, our planet will take good care of itself let time clear the impact of any human malfeasance." (v2,#1)

Gould, Stephen Jay, "A Special Fondness for Beetles," Natural History, January 1993. J. B. S. Haldane's quip that God has an inordinate fondness for beetles leads Gould to examine the estimates for the numbers of beetles in the world. A conclusion: "Our world is incredibly strange and therefore supremely fascinating." Gould is a paleontologist at Harvard University. (v4,#2)

Gould, Stephen Jay, "What Is a Species?" Discover, December 1992. "Species are almost always objective entities in nature. ... Species are not arbitrary units, constructed for human convenience, in dividing continua. Species are the real and objective items of nature's morphology. They are 'out there' in the world as historically distinct and functionally separate populations 'with their own historical role and tendency.' ... Species are unique in the Linnean hierarchy as the only category with such objectivity. ... By grasping the objective status of species as real units in nature ... we may better comprehend the moral rationale for their preservation. You can expunge an arbitrary idea by rearranging your conceptual world. But when a species dies, an item of natural uniqueness is gone forever. Each species is a remarkably complex product of evolution--a branch on a tree that is billions of years old. ... Species are living, breathing items of nature. We lose a bit of our collective soul when we drive species (and their entire lineages with them), prematurely and in large numbers, to oblivion." Gould earlier wrote, "I also appreciate that we cannot win this battle to save species and environments without forging an emotional bond between ourselves and nature as well--for we will not fight to save what we do not love." ("Unenchanted Evening," Natural History, September 1991. (v3,#4)

Gould, Stephen Jay, "An Evolutionary Perspective on Strengths, Fallacies, and Confusions in the Concept of Native Plants." Pages 11-19 in Joachim Wolschke-Bulmahn, ed., Nature and Ideology: Natural Garden Design in the Twentieth Century. Washington, DC: Dumbarton Oaks Research Library and Collection, 1997. Available at <http://www.doaks.org/natur002.pdf> in

<http://www.doaks.org/WONAC.html>. Gould applies his long-standing focus on contingency in natural history to the idea of native and exotic plant species. "Native" does not mean optimally adapted, only locally competent, adequately adapted. Such plants are often poorly competitive against invasives. Exotics can frequently outcompete the natives; they are in fact better adapted. Also natives can become weedy, especially in disturbed soils. The most we can say is that "natives grow appropriately" (p. 15) in their "native" ecosystems.

We cannot say, however, that such natives are in an "appropriate place," because their being there is fortuitous, accidental. "The deepest principle of evolutionary biology [is] the construction of all current biological phenomena as outcomes of contingent history" Native plants being in their places is "laced with chaos, contingency, and genuine randomness" (p. 16). "Native" does not mean much more than "got there accidentally earlier," certainly not "intrinsically suited" as an adapted fit to the place, on account of being there a long time. That the natives were better suited (including indigenous peoples such as native Americans) to their landscapes is "romantic drivel" (p. 17)--despite Gould's having already said that they "grow appropriately." Other paleontologists are not so enamored with Gould's heavy emphasis on contingency. John Maynard Smith, leading theoretical biologist, complains that "Gould is giving non-biologists a largely false picture of the state of evolutionary theory" (quoted in Robert Wright, "The Accidental Creationist," New Yorker, Dec. 15, 1999, p. 56).

Still, Gould likes the natives, though he thinks this has to be on ethical or aesthetic grounds, not scientific grounds. "I do not understand the appeal of the ethical argument that we should leave nature alone and preserve as much as we can of what existed and developed before our very recent geological appearance. Like all evolutionary biologists, I treasure nature's bounteous diversity of species. ... Cherishing native plants does allow us to defend and preserve a maximal amount of local variety" (p. 18). He thinks we ought to "set aside large areas for rigidly minimal disturbance, so that we never forget, and may continue to enjoy, what nature accomplished during nearly all of her history without us." But Gould struggles for a rationale, since these accomplishments of these appropriately growing plants are so contingent. Perhaps the best one is "democratic," "a sensitive cultivation of all plants, whatever their geographic origin" (p. 19). As usual Gould is provocative, and, as usual, not without some confusions himself. (v.12,#4)

Goulet, Denis, Development Ethics, Chinese translation, translator: Gao Shi et al.. Publisher: Social Sciences Documentation Publishing House, 2003

Goulet, Denis, "Ethics and Development," National Geographic Research and Exploration 8(no. 2, 1992):138-147. The global quest for development raises difficult ethical questions about the relation between having goods and being good, the foundations of justice in society, and the proper human stance toward nature. The failure of reductionist economic approaches to development opens the door to ethics to find its place in development debates and practice. Goulet is at the University of Notre Dame. (v4,#1)

Gourlay, Laurie. "Temagami Diary," Alternatives 23(no.2, 1997):10. Ontario's government plans to open up for mining and logging 58 percent of one of the last stands of old growth pine. (v8,#2)

Gowans, Matthew, A Latter-day Saint Environmental Ethic, M. A. thesis, Colorado State University, summer 2001. The Church of Jesus Christ of Latter-day Saints supports a strong environmental ethic. This is developed (1) in teaching regarding the intrinsic value of the "soul," a concept applied not only to humans but to animals, plants, and all living beings (recalling both Biblical and Mormon texts and Aristotle's concept of soul). All creation can express a kind of joy in life. (2) Teachings regarding stewardship show that God expects humans to be stewards of the Earth, a concept defended against criticisms. The principle of sacrifice emphasizes human interdependency and selfless sacrifice. (3)

Latter-day saints work for a promised "Zion," a vision of harmony and flourishing on Earth. (v.12,#3)

Gowans, Matthew and Philip Cafaro. "A Latter-Day Saint Environmental Ethic." Environmental Ethics 25(2003):375-394. The doctrines and teachings of the Church of Jesus Christ of Latter-day Saints support and even demand a strong environmental ethic. Such an ethic is grounded in the inherent value of all souls and in God's commandment of stewardship. Latter-day Saint doctrine declares that all living organisms have souls and explicitly states that the ability of creatures to know some degree of satisfaction and happiness should be honored. God's own concern for the well-being and progress of all life, and His sacrifice through Jesus Christ, illustrate the generous way that He expects His children to exercise their brief stewardship of this world. In addition, the important role nature has played in the religious lives of Latter-day Saint members, from the Prophet Joseph Smith to the present day, argues strongly for wilderness preservation as a spiritual resource for future generations. Gowdy, John M. Review of J. Lemons, and D. Brown, eds. Sustainable Development: Science, Ethics and Public Policy. Environmental Values 8(1999):403. (EV)

Gowdy, John M. "Progress and Environmental Sustainability." Environmental Ethics 16(1994):41-55. One of the most pervasive ideas in Western culture is the notion of progress. Among economists, it is synonymous with economic growth. According to advocates of unlimited growth, more growth will result in a cleaner environment, a stable population level, and social and economic equality. Although most environmentalists do not subscribe to the growth ethic, they generally cling to a notion of progress by arguing that there has been continual enlightenment in public attitudes toward the environment and that this enlightenment can lead to environmental salvation. I argue that there is no convincing argument for past human progress and no reason to believe that it will occur in the future. Once we abandon notions of progress, we free ourselves to concentrate on making do with what we have rather than placing our hopes on some future material or ethical utopia. Gowdy is in the department of Economics, Rensselaer Polytechnic Institute, Troy, NY. (EE)

Gowdy, John M., and Peg R. Olsen, "Further Problems with Neoclassical Environmental Economics." Environmental Ethics 16(1994):161-171. We examine the merits of neoclassical environmental economics and discuss alternative approaches to it. We argue that the basic assumptions of the neoclassical approach, embodied in the indifference curve, make that model inappropriate for environmental analysis. We begin by assuming that the basic postulates of the neoclassical model hold and then argue that even this ideal state is incompatible with environmental sustainability. We discuss the role of the discount rate, the exclusive emphasis on marginal choices, and the assumption of perfect information. Gowdy is in economics at Rensselaer Polytechnic Institute. Olsen is director of the Eastern New York Chapter of the Nature Conservancy. (EE)

Gowdy, John, ed., Limited Wants, Unlimited Means: A Reader on Hunter-Gatherer Economics and the Environment. Washington, DC: Island Press, 1998. Humans, it is said, have unlimited wants and limited means to satisfy these wants, so the end result is scarcity. The central irony of this book is the claim that the hunter-gatherers had structured their lives so that they needed little, wanted little, and for the most part had all the means to satisfy their needs at their immediate disposal, living much more rewarding lives than ours. Sample contents: Marshall Sahlins, "The Original Affluent Society"; James Woodburn, "Egalitarian Societies"; Paul Shepard, "A Post-Historic Primitivism"; Eleanor Leacock, "Women's Status in Egalitarian Society: Implications for Social Evolution." Grange, Joseph, "Being, Feeling, and Environment," Environmental Ethics 7(1985):351-364. The philosophies of Spinoza and Heidegger as the source of a "unitive vision" of reality is developed as a basis for environmental studies. (Katz, Bibl # 1)

Grange, Joseph. Nature: An Environmental Cosmology. Albany: State University of New York Press,

1997. 352 pages. \$ 19.95. Drawing on Whitehead, in contrast to both analytic philosophy and the continental tradition, Grange constructs a metaphysics to reflect what is true and right and fitting about how humans should act as participants in a finite and intrinsically interconnected world. Celebrates the very real glories of nature without sentimentalism and without any depreciation of human beings. Reviews and critiques the major positions in ecological ethics. Grange is in philosophy at the University of Southern Maine, Portland. (v7,#4)

Grange, Joseph. "Being, Feeling, and Environment." Environmental Ethics 7(1985):351-64. Despite the 300 years of philosophy separating them, Spinoza and Heidegger are committed to a unifying vision of the human and the natural. Such a perspective encourages a renewed understanding of the place of feelings in environmental studies. Neither untrustworthy reactions nor neutral reading of environmental stimuli, human feelings are the basic way in which we encounter the world. The primordial character of emotions in both Spinoza and Heidegger follows from their commitment to the unity of reality. An understanding of both thinkers opens up being, feeling, and environment as the proper subject matter of ecology. Environmental studies will begin to advance again when it dedicates itself to the potential riches of such a unitive vision. Grange is at the Philosophy Dept., University of Southern Maine, Portland, ME. (EE)

Grant, Don Sherman, III. "Religion and the Left: The Prospects of a Green Coalition." Environmental Ethics 19(1997):115-134. Religionists and leftists have aligned themselves with several green causes, but have yet to engage each other in a real discussion of environmental issues. I try to establish the basis for a dialogue between those segments of the religionist and leftist traditions that appear to have the most promise for forging a united green front. I label these two subgroups constructive postmodern religionists and constructive postmodern leftists. I summarize the key ideas shared by each group, discuss how each can rectify some of the weaknesses of the other, and consider some potential philosophical barriers to their union. I conclude by issuing a call for dialogue on the issues presented here. Grant is in sociology, University of Arizona, Tucson. (EE)

Grant, James P., ed., The State of the World's Children 1991, published for UNICEF by Oxford University Press, 1991. Of particular interest is the section on "The Population Question," where Grant argues that reducing infant mortality through better nutrition and health care today will not lead to greater population increases tomorrow, nor to increased environmental degradation, but, to the contrary, will reduce the future birthrate and contribute to environmental conservation. A careful, nuanced claim, based on statistical data showing that, whereas early declines in mortality rates typically do not reduce birthrates, later declines in mortality do reduce them sharply, and that most developing nations are now at this point. This is important reading for anyone concerned with population growth, children, and the environment. James P. Grant is executive director of UNICEF. (v2,#2)

Grant, Lindsey, The Collapsing Bubble: Growth and Fossil Energy. Seven Locks Press, Santa Ana, CA, 2005. The worlds dwindling energy resources. The energy debate has been cast in the wrong terms. But with a bit of luck we may be able to create a more harmonious balance with the rest of the biosphere, at much lower population levels and less consumptive habits. Lindsey Grant is a retired Foreign Service Officer, formerly Deputy Secretary of State for Environmental and Population Affairs.

Grant, Lindsey, ed., Elephants in the Volkswagen: Facing the Tough Questions about our Overcrowded Country. W. H. Freeman, 1992 272 pages, \$ 22.95. Essays on population and development. The U. S. population today is 252 million, but based on "carrying capacity," how much human activity the country's land, air, and water resources can sustain on a long-term basis, the optimum population may be no more than 135 million. "Population growth may wipe out the progress we are trying to make in other areas of public policy." (v3,#2)

Grant, Lindsey, Juggernaut: Growth on a Finite Planet. Santa Ana, CA: Seven Locks Press, 1996. 310 pages. \$ 18.95. Population growth is leading us to a world we do not want, more crowded, with less personal freedom, more polluted and paved over, with less room for biodiversity. The first half of the book deals with world trends. The second half of the book focuses on the U.S. The U.S. population is growing by approximately 10% per decade. Alone among the rich industrialized nations, America's population is still growing because of a higher rate of fertility and generous immigration policies. Both in terms of curbing effluents and preserving wildlands, ending population growth will be the key. Grant is a former U.S. foreign service officer and Deputy Assistant Secretary of State for Environment and Population Affairs. (v.8,#4)

Grant, Lindsey. Too Many People: The Case for Reversing Growth. Santa Ana, CA: Seven Locks Press, 2000. "The recent growth of human populations has imperiled the pursuit of economic prosperity and social justice and has placed undue strain on the natural support systems that all creatures depend upon." In this short handbook (102 pages), Grant examines some of the major issues of our times and argues that uncontrolled population growth lies at their heart. "Food, water, land, air, climate, and energy resources are all threatened by ever increasing numbers of people inhabiting the Earth." A clear, straightforward text, ideal as a supplement for classes in environmental ethics that seek to treat population issues. (EE v.12,#1) Grant was formerly a Foreign Service Officer, National Security Council, Department of State Policy Planning, and also Deputy Assistant Secretary of State for Environment and Population Affairs. Gray, Patricia M., Krause, Bernie, Atema, Jelle, Payne, Roger, Krumhansl, Carol, and Baptista, Luis, "The Music of Nature and the Nature of Music," Science 291(5 January 2000):52-54. "Rather than being the inventors of music, we are latecomers to the musical scene." The authors find music not only in humans but in whales, birds, even insects. Whale and bird songs, if genetically disposed, are also acquired. "Whales from different oceans sing completely different songs." Whales and birds seem to prefer patterned tones and rhythms rather similar to those humans prefer. "The similarities among human music, bird song, and whale song tempt one to speculate ... that there is a universal music awaiting discovery." This would be rather like Platonic mathematics. "Do musical sounds in nature reveal a profound bond between all living things?"

Such pervasive "music" is discovered partly by discoveries about animal sounds, but also by redefining the term "music," somewhat similarly to the way animal "culture" is often as much a redefinition of "culture" as new discoveries about animal behavior. Acquired bird songs are here part of their "culture" (p. 53) "Music has been defined as patterns of sound varying in pitch and time produced for emotional, social, cultural and cognitive purposes." Songs, seemingly synonymous with music, "can be defined as any rhythmic repeated utterance whether by a bird, a frog, an insect, a whale or a human being." There is no discussion here of the functional nature of such calls (territorial calls, mating, group location) and whether and how this relates to aesthetic capacities and experience. An accompanying article is:

--Tramo, Mark Jude, "Music of the Hemispheres," Science 291(5 January 2000):54-56. Music is universal in human cultures and this seems to indicate that the human brain is constructed so as to produce and enjoy music. Areas of the brain that may be involved in different aspects of music perception and performance. (EE v.12,#1)

Gray, R.H., "Corporate Reporting for Sustainable Development: Accounting for Sustainability in 2000 A.D." Environmental Values 3(1994):17-45. This paper is principally concerned with (a) outlining the range of possibilities that exist for organizations which wish to undertake environmental and sustainability reporting and (b) suggesting particular approaches as the more desirable. There is an important difference between environmental reporting and reporting for sustainability, but are both shown to be essential and practicable. It is argued, however, that there is little or no prospect of widespread, systematic reporting by corporations without a major regulatory initiative. KEYWORDS: Accounting, environmental accounting and reporting, social reporting, sustainability. Gray is with the Dept. of Accounting and Business Finance, University of Dundee, U.K. (EV)

Grayson, Donald K., "The Archaeological Record of Human Impacts on Animal Populations," Journal of World Prehistory 15(no. 1, 2000):1-68. Humans in the past had widespread influence on wild animal populations, most dramatically in the Pacific Islands, especially Oceania. There were also evident influences on continental populations. Three main factors were involved: hunting for animal prey, humans setting fires, and human introductions, deliberately and accidentally, of nonnative animals, often carrying diseases. On islands these interruptions regularly led to extinctions, although predation alone did not. Vegetational change and the introductions of exotics were more significant. The Polynesians may have caused the extinction of half the endemic avifauna of Hawaii. Indigenous people typically overhunted the large prey first, and then turned to smaller prey. There is little evidence that indigenous peoples were good conservationists. They depleted resources almost everywhere. "Conservationists may well be clamoring for an answer to the question whether indigenous peoples conserve biodiversity, but archaeologists answered that question long ago" (p. 49).

But Grayson is equally convinced that overhunting did not cause extinctions on continents, especially not in North America and probably not in Australia. The overhunting hypothesis would require hunting a variety of now extinct mammals in substantial numbers, and there should be kill sites. But "such evidence exists only for mammoth and, far less securely, for mastodon. There is no evidence that people hunted, or even scavenged any of the other ungulates--or sloths, dayspodids (armadillos), glyptodonts (armadillo-like), or rodents. ... Horses and camels are extremely well represented in the late Pleistocene record of North America, but there are no kill sites for them" (p. 37). Also the timing of the extinctions is problematic. Climate is a more likely factor.

On continents too there was no widespread change in the flora. "It is also true that there is no evidence for significant, colonization-linked anthropogenic impacts on North American vegetation of the sort that are so evident in such places as New Zealand, Hawaii, Mangaia (Cook Islands), Yap, Easter Island" (p. 42). Green, JL et al., "Complexity in Ecology and Conservation: Mathematical, Statistical, and Computational Challenges," BioScience 55 (no. 6, June 2005): 501-510.

Creative approaches at the interface of ecology, statistics, mathematics, informatics, and computational science are essential for improving our understanding of complex ecological systems. For example, new information technologies, including powerful computers, spatially embedded sensor networks, and Semantic Web tools, are emerging as potentially revolutionary tools for studying ecological phenomena. These technologies can play an important role in developing and testing detailed models that describe real-world systems at multiple scales. Key challenges include choosing the appropriate level of model complexity necessary for understanding biological patterns across space and time, and applying this understanding to solve problems in conservation biology and resource management.

Green, Judith M. "Retrieving the Human Place in Nature." Environmental Ethics 17(1995):381-396. The present worldwide ecological crisis challenges both some fundamental Western cultural assumptions about human relationships to nature and the efficacy of democratic institutions in transforming these relationships appropriately and in a timely manner. I discuss what kind of ecophilosophy is most feasible and desirable in guiding rapid and effective response to the present crisis in the short term, as well as positive cultural transformation in the West toward sound natural and social ecology in the longer term. I argue that decontextualized liberal ecophilosophies and related deep ecologies are inadequate to these purposes and propose a Green transformative framework that "re-replaces" humans within nature, "re-repositions" our understanding of ourselves in relation to the land, "re-repairs" intrinsic values in nature with human responsibilities, and "re-re-directs" the effective use of participatory democratic institutions in trans-forming public policy. Green is in the department of philosophy, University of Seattle. (EE)

Green, Karen, "Freud, Wollstonecraft, and Ecofeminism: A Defense of Liberal Feminism." Environmental Ethics 16(1994):117-134. I examine recent arguments to the effect that there are significant logical, conceptual, historical, or psychosexual connections between the subordination of

women and the subordination of nature and argue that they are all problematic. Although there are important connections between women's emancipation and the achievement of important environmental goals, they are practical connections rather than conceptual ones. Green is in philosophy, Monash University, Australia. (EE)

Green, Karen, "Two Distinctions in Environmental Goodness," Environmental Values 5(1996):31-46. In her paper, "Two Distinctions in Goodness" (The Philosophical Review 92(1983):169-95), Christine Korsgaard points out that while a contrast is often drawn between intrinsic and instrumental value there are really two distinctions to be drawn here. One is the distinction between intrinsic and extrinsic value, the other is that between having value as an end and having value as a means. In this paper I apply this contrast to some issues in environmental philosophy. It has become a commonplace of environmentalism that there are intrinsic values in nature. What is usually meant by this is that some values in nature are not merely instrumental to human ends. By using the notion of intrinsic value to express this philosophers have developed positions which are open to a number of meta-ethical and practical objections. The view that there are objective values in nature, which are independent of human interests, is better served by an environmental philosophy which sees most value in nature as objective, extrinsic value. The resulting environmental ethic is sketched and some apparent difficulties discussed. KEYWORDS: Intrinsic value, instrumental value, meta-ethics, subjectivism, biocentrism. (EV)

Green Pages, The: Your Everyday Shopping Guide to Environmentally Safe Products (New York: Random House, 1990). \$8.95. 238 pages. (v2,#1)

Green, Rhys E. et al., "Farming and the Fate of Wild Nature," Science (28 January 2005):550-555. Farming is already the greatest extinction threat to birds (the best known group) and the situation will grow worse especially in developing countries. Two solutions have been proposed (1) wildlife-friendly farming, which boosts densities of wild populations on farmland but may decrease agricultural yield and (2) land-sparing farming, which minimizes demand on farmland by increasing yield. The authors propose a way to resolve the tradeoffs between these two approaches, but generally hold that high-yield farming will allow more species to persist. Green is in zoology, University of Cambridge, UK. With critical comment about dimensions these authors overlook, and reply, Science 308(27 May 2005):1257.

Green, Ronald M. *Babies by Design: The Ethics of Genetic Choice*. New Haven: Yale University Press, 2007. Parents have autonomy over their future children. This includes the right of parents to undertake genetic changes that they believe will benefit their child and enhance his or her life prospects. Embryo selection to avoid inherited disease is already in practice; therapeutic gene alteration to avoid diseases in embryos is on the horizon. We will afterward move to genetic enhancement and make future people "better than well." This includes cosmetico-genomics, where parents use prenatal or preconceptual genetics to improve a child's height, reduce his or her chances of obesity, and even select a child's skin or hair color. What about intellectual ability, athletic ability, and sexual attractiveness? For doubts about such eugenics, see *The Case against Perfection* by Michael Sandel (Cambridge, MA: Harvard University Press, 2007).

Greenbaum, Allan, "Nature Connoisseurship," Environmental Values 14(2005): 389-407. Environmentalists who seek to protect wild nature, biodiversity and so on for its own sake manifest a disposition to value the interesting at least on par with the useful. This disposition toward the interesting, which provides the affective and cognitive context for the discovery of intrinsic values in nature and the elaboration of ecocentric ethics, does not arise simply from learning about nature but is part of a more general socially inculcated cultural system. Nature connoisseurship exhibits formal parallels with art connoisseurship. The abstraction-oriented cultural system which prizes 'disinterested interest' is characteristic of culturally rich fractions (or subdivisions) of the middle class in modern Western societies. Valuing nature for its own sake (like valuing, for its own sake, the domination of nature) is not

a 'natural' response to nature but a disciplined cultural accomplishment. Greenbaum is in social science, York University, Toronto, Ont. (EV)

Greenbaum, Allan. "Environmental Thought as Cosmological Intervention." Environmental Values 8(1999):485-497. ABSTRACT: An important tradition in popular and academic environmentalist thought concentrates on cosmological issues, to do with overarching (or underlying) views about the nature of reality and the place of humanity in nature. This tradition connects the environmental crisis with anthropocentric and mechanistic cosmologies, and tries to address this crisis through cosmological critique and reconstruction - a practice I call "cosmological intervention". This practice presupposes a link between "world view" and "ethos". I argue that an environmentalist ethos does not necessarily or automatically follow from the world view elements propounded in cosmological interventions. Rather, world view symbolises ethos. Cosmologies favoured by environmentalists describe the abstract and necessary properties of the world in ways which reflect those concrete and contingent properties of the world that the ecology movement seeks to protect, extend and celebrate. KEYWORDS: Cosmology, worldview, deep ecology, environmental thought. Allan Greenbaum 873 Palmerston Ave., Toronto, Ontario, Canada M6G 2S3. (EV)

Greenberg, Michael, Schneider, Dona. Environmentally Devastated Neighborhoods: Perception, Policies, and Realities. New Brunswick, NJ: Rutgers University Press, 1996. 300pp. \$60 cloth. Beginning with a call for a definition of "environment" that fits the realities of neighborhoods, the authors argue for and propose policy initiatives that address all the desperate needs of these beleaguered places. Greenfield, Joanna, "Hyena," The New Yorker 52(no. 34, November 11, 1996):74-81. The author is attacked by a hyena in a reserve in Israel, while servicing the pen in which it is caged. There is an Israeli reserve housing all of the animals mentioned in the Bible. With some graphic prose about the attack, and about hyenas in Kenya. "Spotted hyenas are the sharks of the savanna, superpredators and astounding recyclers of garbage. They hunt in large, giggling groups, running alongside their prey and eating chunks of its flesh until it slows down through loss of blood, or shock, or sheer hopelessness, and then the hyenas grab for the stomach and pull the animal to a halt with its own entrails or let it stumble into the loops and whorls of its own body."

Greenhouse Defect, The." The Christian Science Monitor, vol. 89, 10 March 1997, p. 20.

Greenhouse, Linda, "Justices Bar Wide U.S. Role Under the Clean Water Act," New York Times (01/10/01): A13. U.S. Supreme Court decisions weakens wetland's protection. A 15 year-old protection for isolated wetlands used by migratory birds was struck down by the court as unjustified federal intrusion into states' traditional rights to manage land and water. The U.S. Army Corp of Engineers was given the right to regulate "navigable waters" and those that abut them by the Clean Water Act of 1972. It later adopted the "migratory bird rule" that regulated the dredging and filling of ponds and wetlands separate from navigable rivers or their tributaries, in part because migratory birds that cross state lines used these wetlands. The Court held that the rule extended beyond the intention of Congress when it adopted the Clean Water Act. Because few states protect such isolated wetlands, the ruling could end protection for as much as 20 percent of the country's wetlands. Over 50 percent of the nation's wetlands have already been lost. (v.12,#2)

(v.11,#2)

Greenwood, Dan, "Non-Market Coordination: Towards an Ecological Response to Austrian Economics," Environmental Values 17(2008):521-541. Although the ecological tradition tends to favour a substantive role for non-market institutions in securing objectives such as environmental sustainability, Green theorists have paid relatively little attention to the important challenge posed to such proposals by the pro-market arguments of Austrian economics. The methods of ecological economics, such as multiple criteria evaluation, offer important potential for responding to the Austrian thesis that democratic, non-market institutions face a coordination problem in the face of complexity. However, the development of an adequate ecological response to the Austrians requires clarification of the conceptual underpinnings and potential scope of such methods.

Gregory, Robin S., "Incorporating Value Trade-offs into Community-Based Environmental Risk Decisions," Environmental Values 11(2002):461-488. Although much attention has been given to the role of community stakeholders in developing environmental risk-management policies, most local and national initiatives are better known for their failings than their successes. One reason for this continuing difficulty, we contend, is a reluctance to address the many difficult value trade-offs that necessarily arise in the course of creating and evaluating alternative risk-management options. In this paper we discuss six reasons why such trade-offs are difficult and, for each, present helpful techniques from the decision sciences along with case study examples of successful applications. (EV)

Gregory, Robin, Sara Lichtenstein, and Paul Slovic, "Valuing Environmental Resources: A Constructive Approach," Journal of Risk and Uncertainty 7(1993):177-197. Contingent valuation methods for environmental values have been increasingly used in recent years, but much doubt exists about their validity. The authors here argue that the usual form of such surveys puts unreasonable cognitive demands on the person surveyed; they are asked to place monetary value on goods that are not represented in their minds in monetary form. Such surveys ought not to be thought of as discovering what values the respondent already has, but rather as a means of helping the respondent construct explicitly values that he or she only holds tacitly. They suggest a new approach, based on the value-structuring capacities of multi-attribute utility theory and decision analysis. The authors are with Decision Research, Eugene, Oregon. (v5,#4)

Greider, William. One World, Ready or Not: The Manic Logic of Global Capitalism. New York: Simon and Schuster, 1997. Although the rapid spread of free market capitalism has created many pockets of prosperity, the world economy has spun out of control and is heading for a cataclysmic fall. There are three ominous, converging trends. First, the world will soon be awash in surplus goods. Profitability depends on producing goods where wages are too low for workers to purchase these goods, and selling where wages are high, but there will not be enough well-paid workers to buy these goods. Second, there is the rapid, constant flow of money across borders, with those who control this flow having more power than governments, and insisting on high returns where these will not be possible. Third the planet cannot sustain rapid industrialization for the masses in under-developed countries without irreparable environmental damage. The losers in the global economy--those earning rock bottom wages, those who suffer when growth slows, those who live with the worst effects of environmental degradation--far outnumber the winners. Nevertheless, Greider suggests much can be done, and he is generally pro-growth. Reviewed by Jeffrey E. Garten in Harvard Business Review, January/February 1997. (v8,#1)

Grey, William, "Possible Persons and the Problems of Posterity," *Environmental Values* 5(1996):161-179. The moral status of future persons is problematic. It is often claimed that we should take the interests of the indefinite unborn very seriously, because they have a right to a decent life. It is also claimed (often by the same people) that we should allow unrestricted access to abortion, because the indefinite unborn have no rights. In this paper I argue that these intuitions are not in fact inconsistent. The aim is to provide an account of trans-temporal concern which resolves the prima facie inconsistency between commonly held intuitions about our obligations to future persons. I argue that our intuitions can be reconciled provided that we explicate obligations to the future in terms of impersonal principles subject to retroactive person-affecting constraints. KEYWORDS: Future persons, duty to posterity, Parfit (EV)

Grey, William, "A Critique of Deep Ecology." *Journal of Applied Philosophy* 3, no. 2 (1986): 211-216. Grey criticizes the type of Deep Ecology position that relies on "non-Western" anti-technological attitudes, and he urges that we develop an environmentally conscious world-view based on science. He also criticizes Deep Ecologists for talking of a "paradigm" of Deep Ecology: this suggests one and only one acceptable Deep Ecology view. (Katz, Bibl # 1)

Grey, William, "Anthropocentrism and Deep Ecology", *Australasian Journal of Philosophy*, 71 (1993):463-75. A predominant theme in environmental philosophy is the claim that we need to correct an anthropocentric bias in our attitudes to the nonhuman world, and in particular to extend moral concern across time and across species. This is the central claim of "deep ecology", which maintains that the uncritical acceptance of anthropocentric values has abetted reprehensible practices with respect to the

nonhuman world. In this paper the author argues that this central claim of "deep ecology" is mistaken and provides a defence of qualified anthropocentrism. Deep ecology is a response to human activities which have a detrimental impact on the planet's living systems. These judgments, however, are possible only if we assume a set of values based on human preferences. It is the short-sighted and narrow self-regarding conception of human well-being that needs to be rejected, not anthropocentrism.

Grey, William, "Environmental Value and Anthropocentrism," Ethics and the Environment 3(1998):97-103. The critique of traditional Western ethics, and in particular its anthropocentric foundations, is a central theme which has dominated environmental philosophy for the last twenty years. Anthropocentrism is widely identified as a fundamental source of the alienating and destructive attitudes towards the nonhuman world which are a principal target of a number of salient ecophilosophies. This paper addresses a problem about articulating the concern with anthropocentrism raised by the influential formulations of deep ecology by nature liberation proponent Val Plumwood. Grey is in philosophy, University of Queensland, Brisbane, Australia. (E&E)

Grijalva, James M. *Closing the Circle: Environmental Justice in Indian Country*. Durham: Carolina Academic Press, 2008. Grijalva shows how federal-state partnerships of United States environmental law fails in Indian country where state regulatory jurisdiction is constrained by federal Indian law, leaving a void of effective environmental regulation that threatens the survival of American Indian tribes. He argues that a potential solution to this problem is to provide state-like status to sovereign tribal governments.

Grimm, David. "This Man Wants to Green Your Lab." *Science* Vol. 318, no. 5847 (5 October 2007): 39-41. Allen Doyle, a soil ecologist at the University of California, Santa Barbara, finds that too many scientists, though they may be green at home, forget about whether their labs are green. Getting the research done and published takes top priority, with the ecological footprint of the lab ignored. Doyle lists many ways to save money, be more efficient, and "green" at the same time. He finds some scientists co-operative, but most still have no time to think about it. In his own lab building, he saved \$16,000 a year just by turning off unused ventilation hoods. Some of the major issues include recycling plastic tubes and old electronics.

Grimshaw, Michael, "Seeing through God: Towards an Eco A/Theology," Ecotheology Vol 6 (Jul 01/Jan 02):186-199. migrimshaw@phil.canterbury.ac.nz Although often viewed as an aberration in theology, the application of deconstructionist thought provides a way of approaching the theological task that enables issues of context to be debated in a new way. By applying notions of inter-textuality to the basis provided by the liminal / of Mark C Taylor's a/theology, it is possible to trace a path from land/scape to in/scape to a theo/scape. By in turn deconstructing Taylor's a/theology, an eco a/theology is proposed that raises the possibility of framing god as presence in absence. As such, God is that which holds together and frames the views through which we perceive and create the world. Theology becomes eco a/theology not in a universalist, globalistic narrative, but rather that which takes seriously the contested claims of contextual theologies and hints at a knowledge and experience of 'God' that is located in an experience of the local context.

Grinde, Donald A, and Bruce E. Johansen, Ecocide of Native America: Environmental Destruction of Indian Lands and Peoples. Clear Light Press, 1995. \$24.95. Argues for the Native American policy of sustainability, and reports on contamination of reservations by industrial and radiation waste. (v6,#2)

Grizzle, Raymond E., and Barrett, Christopher B., "The One Body of Christian Environmentalism," Zygon 33(1998):233-253. Using a conceptual model consisting of three interacting spheres of concern--environmental protection, human needs provision, and economic welfare--central to most environmental issues, we map six major Christian traditions of thought. Our purpose is to highlight the complementarities among these diverse responses in order to inform a more holistic Christian environmentalism founded on one or more of the major tenets of each of the six core traditions. Our approach also incorporates major premises of at least the most moderate versions of biocentrism, ecocentrism, and anthropocentrism. We label this holistic approach "cosmocentrism" and use it as the basis for a preliminary description of the notion of "pluralistic stewardship." We argue that only such holistic environmental perspectives, where societal needs are more directly coupled with environmental protection, and a pluralism of worldviews are acknowledged as potentially contributing to such efforts are capable of successfully addressing the complex issues we face today. We note that, at the international level in particular, Christian thought and secular environmentalism already have been moving in such a direction. Grizzle teaches environmental studies at Taylor University, Upland, NY. Barrett is in

economics, Utah State University. (v9,#2)

Grizzle, Raymond E., "Environmentalism Should Include Human Ecological Needs," BioScience 44(1994):263-268. In most environmentalism, "human ecological needs are not explicitly considered. Humans are viewed as protectors of the environment but not direct participants in ecosystem processes. I find this view incomplete because it does not address the full range of ecological relationships between humans as a species and their environment. ... This shortcoming seriously undermines the prospect for further consensus among environmentalists. ... [We need] a more holistic environmentalism ... Humans are part of nature and subject to the same broad principles as are other organisms. Clearly, humans are in some ways different from other species, but I see no compelling reason for excluding them from nature. ... We can be thought of as a potential predator, prey, competitor, and/or symbiont." Grizzle teaches biology at Campbell University, Buies Creek, N. C. (Thanks to Naomi Krogman, University of Southwestern Louisiana.)

Gross, Michael, Life on the Edge: Amazing Creatures Thriving in Extreme Environments. Plenum, 1998. \$ 25.95. The extent to which living organisms, predominantly single-celled, are found thriving in situations so extreme as to have been assumed, until recently, to be unable to support life. Bears on the origin of life on Earth, also the possibility of extra-terrestrial life. Also the ingenuity of life on Earth. (v.9,#4)

Gross, Paul R., Levitt, Norman, and Lewis, Martin W., eds., The Flight from Science and Reason. New York: New York Academy of Sciences, 1996. Distributed by Johns Hopkins University Press. 593 pages. A large volume with many contributors worried about the deconstruction, relativizing, contextualizing, or whatever, of science. One section is on the environment:

--Lewis, Martin, W., "Radical Environmental Philosophy and the Assault on Reason," pp. 209-230. The resentment of science embedded in fashionable ecomania must subvert or misdirect serious and necessary environmental initiatives. Lewis is the author of Green Delusions.

--Rothman, Stanley, and Lichter, S. Robert, "Is Environmental Cancer and Political Disease?," pp. 231-245. Scientists working in cancer epidemiology have a far different view of what constitutes a serious threat of environmental cancer than nonscientists who regard themselves as activists for environmental sanity. Rothman teaches government at Smith College. Lichter is the author of Keeping the News Media Honest.

--Denfeld, Rene, "Old Messages: Ecofeminism and the Alienation of Young People from Environmental Education," pp. 246-255. Contrasts the romantic eco-radicalism endemic among "difference" or "gender" feminists with the serious and committed environmentalism that it displaces or discourages. Young people, and young women especially, have had deflected their serious interest in environmental questions

by the sectarianism, the woolly self-righteousness, and the disdain for science that have characterized ecofeminism. Fortunately, "the message of ecofeminism, and of the environmental movement that adopts it, is unlikely ever to gain widespread support among upcoming generations" (p. 253). Denfeld is the author of The New Victorians: A Young Woman's Challenge to the Old Feminist Order. (v9,#2)

Gross, Rita M., "Toward a Buddhist Environmental Ethic," Journal of the American Academy of Religion 65(1997):333-353. The key is the concept of trishna, desire (Sanskrit), or tanha (Pali). "More is not better whether it is more people or more consumables. 'Growth,' the god we worship is a false idol, needing to be replaced by 'no growth,' if not by 'negative growth.' 'Growth' and 'more' represent the unbridled reign of trishna, not appreciation and reverence for the interdependent matrix of the environment in which we live and upon which we depend unconditionally ... With enough meditation and contemplation of interdependence, trishna will give way to equanimity." Gross is in religion at the University of Wisconsin, Eau Claire. (v8,#3)

Grove-White, Robin, and Mike Michael. "Talking about Talking about Nature: Nurturing Ecological Consciousness." Environmental Ethics 15(1993):33-47. The increasing effort, both lay and academic, to encourage a transition from an "I-It" to an "I-Thou" relation to nature is located within a typology of ways

of "knowing nature." This typology provides the context for a particular understanding of human conversation which sees the relation as a cyclical process of "immersion" and "realization" from which a model of the dialectic between "I-It" and "I-Thou" relations to nature can be developed. This model can be used to identify practical measures that can be taken as first steps toward a balance between these relations, both in general and in the context of science-oriented nature conservation organizations such as English Nature in Britain (formerly, the Nature Conservancy Council). Grove-White is at the Centre for Study of Environmental Change, Lancaster University, Lancaster, UK. Michael is at the School of Independent Studies, Lancaster University, Lancaster, UK. (EE)

Grove-White, Robin and Bronislaw Szerszynski, "Getting Behind Environmental Ethics." Environmental Values Vol.1 No.4(1992):285-296. ABSTRACT: There are major problems in the way in which the environmental 'ethics' question is now being framed--problems which could lead to growing confusion and disillusionment, unless they are rapidly addressed and understood. It is on such problems that this paper focuses. We point to three dimensions of the environmental 'phenomenon' which prevailing accounts of environmental ethics are tending to overlook. We then identify several ways in which incomplete ethical models tend to be reflected in actual environmental policy discourse. Finally, we suggest three hitherto-absent ingredients which will need to be recognised if future models of the ethics question are to be able to reflect, and hence to engage adequately with, social reality. KEYWORDS: Culture, ethics, environmental policy, hermeneutics, technocracy. Centre for the Study of Environmental Change, Lancaster University, UK.

Gruen, Lori and Dale Jamieson, eds., Reflecting on Nature: Readings in Environmental Philosophy. New York: Oxford University Press, 1994. 384 pages. Paper, \$ 24.95. The first anthology to highlight the problems of environmental justice and sustainable development. A multicultural perspective, featuring feminist and minority scholars and scholars from developing countries. Biodiversity loss, the meaning and significance of wilderness, population and overconsumption, and the human use of other animals. Readings span centuries of philosophical, naturalist, and environmental writing--Aristotle, Locke, Darwin, and Thoreau--as well as contemporary figures like Bernard Williams, Thomas Hill, Jr., and Jonathan Glover. Val Plumwood, Bill Devall, Murray Bookchin, and John Dryzek comprise a radical ecology section. The sections are: I. Images of Nature. II. Ethics and the Environment. III. Alternative Perspectives. IV. Sustainable Development and International Justice. V. Contemporary Issues and Controversies. Another fine anthology added to a list of a dozen anthologies and single authored volumes

that have appeared in the last two years, see listing in Newsletter, 4, 3. Both authors are in philosophy at the University of Colorado. (v4,#4)

Gruen, Lori, "On the Oppression of Women and Animals," Environmental Ethics 18(1996):441-444. Beth Dixon is unable to understand what is problematic about the categorical division between humans and other animals and so is unable to understand the ecofeminist argument against the oppression of animals. (EE)

Gruenfeld, Jay, Purple Hearts and Ancient Trees: A Forester's Life Adventures in Business, Wilderness, and War. Seattle, WA: Peanut Butter Publishing, 1998. 352 pages. Gruenfeld is an industrial forester and wilderness enthusiast. He runs his own forestry consulting business in the Seattle area, specializing in international log marketing. He earned two forestry degrees from Colorado State University and was a Fulbright scholar at Oxford University in philosophy and politics. He was an infantryman in combat in World War II in the Pacific, wounded five times and awarded the Purple Heart three times. Wilderness is vital to Gruenfeld, primarily because wilderness is the setting for his favorite forms of outdoor recreation. Nevertheless he would open up existing designated wilderness to commercial timber harvesting of about 25% of the total volume. The war theme returns in the Pacific Northwest, where there is a "war" between contesting parties over the future of the forests. (v.9,#3)

Grumbine, Ed, "No Going Back to Tradition," Review of: Meffe, G. K., L. A. Nelson, R. L. Knight, and D. A. Shenborn, Ecosystem Management: Adaptive, Community-Based Conservation. Washington, DC: Island Press, 2003. (v. 15, # 3)

Grumbine, R. Edward "Viable Populations, Reserve Size, and Federal Lands Management: A Critique," Conservation Biology, vol. 4, no. 2, June 1990. Current viable population theory and reserve size studies suggest that biological diversity for North American national parks and forests is inadequately protected, a problem compounded by lack of landscape-level management, competition between federal land management agencies, and bureaucratic inertia. An ecosystem management model for reform is outlined. (v1,#2)

Grumbine, R. Edward, Environmental Policy and Biodiversity. Washington, DC: Island Press, 1994. 416 pages. 21 articles. \$ 22.00 paper. \$ 45.00 hardbound. Four parts: Conservation Biology: Theories and Principles for Policy and Management; Toward a Common Law of Ecosystem Management; Applying Conservation Biology in the Real World: Case Studies; Conservation Science, Politics, and Policy-Making. Sample articles: Michael Soule and Daniel Simberloff, "What Do Genetics and Ecology Tell Us about the Design of Nature Reserves?"; Daniel J. Rohlf, "Six Biological Reasons Why the Endangered Species Act Doesn't Work and What to Do about It"; Susan MacKenzie, "Great Lakes Intergovernmental Cooperation: A Framework for Endangered Species Conservation"; Donald Ludwig, Ray Hilborn, and Carl Walters, "Uncertainty, Resource Exploitation, and Conservation: Lessons from History." Grumbine is director of the Sierra Institute, University of California Extension, Santa Cruz. (v5,#4)

Grumbine, R. Edward, Ghost Bears: Exploring the Biodiversity Crisis. Washington, DC: Island Press, 1992. 336 pages. \$ 25.00 hardcover. A species centered approach will ultimately fail to protect ecosystems and diversity. Using the fate of the endangered grizzly bear (the "ghost bear") to explore the causes and effects of species loss and habitat destruction, Grumbine surveys the big picture, weaving together conservation biology, natural history, environmental policy, law, ethics, and grassroots activism into a comprehensive conservation strategy. Grumbine urges that humanity enter into a greater partnership with nature, working with it, rather than attempting to control it. Reed Noss says, "I have seen no better rendering of modern conservation science into readable prose." Grumbine is Director of the Sierra Institute, University of California Extension, Santa Cruz. (v3,#4)

Grumbine, R. Edward, "What is Ecosystem Management?" Conservation Biology 8(no. 1, March 1994):27-38. The evolving model of ecosystem management is analyzed for a working definition. There are five specific goals: maintaining viable populations, ecosystem representation, maintaining ecological processes, such as natural disturbance regimes, protecting evolutionary potential of species and ecosystems, and accommodating human use in the light of these goals. Short-term and long-term policy implications are reviewed, including evaluation success. Ecosystem management is not just about science nor is it simply an extension of traditional, resource management. It requires a fundamental reframing of how humans may work with nature. Grumbine directs the Sierra Institute, University of California Extension, Santa Cruz. (v5,#2)

Grumbine, R. Edward. "Reflections on "What is Ecosystem Management?" Conservation Biology 11 (no.1, 1997):41. Ten dominant themes of ecosystem management, described in a previous paper, reviewed on the basis of feedback from managers actively implementing ecosystem management. Key points include the importance of managing for ecological integrity, the need for social as well as scientific data, suggestions for implementing cooperation strategies and conservation partnerships, a pragmatic definition of adaptive management, and first steps toward changing the structure of natural resource organizations. Grumbine is at the Sierra Institute, University of Santa Cruz, CA. (v8,#2)

Grumbine, R. Edward, "Cooperation or Conflict? Interagency Relationships and the Future of Biodiversity for U.S. Parks and Forests," Environmental Management 15, no.1, 1990. So far the Forest Service and the National Park Service have done little cooperatively to implement the biodiversity mandates of such laws as the Endangered Species Act and the National Forest Management Act. The ideological and political histories of the Forest Service and the Park Service are explored to determine the roots of interagency conflicts. Several recent models of cooperative reform are critiqued. Cooperation must be framed within conservation biology and must place primary emphasis on ecosystem patterns and processes as well as on individual species. Management policies must be reframed within a context of ecocentric values. Grumbine is Director, the Sierra Institute, University of California, Santa Cruz. (v1,#4)

Grumbine, R. Edward. "Using Biodiversity as a Justification for Nature Protection," Wild Earth 6(1996):71. (v8,#1)

Grumbine, R. Edward, "Wildness, Wise Use, and Sustainable Development." Environmental Ethics 16(1994):227-249. Ideas of wilderness in North America are evolving toward some new configuration. Current wilderness ideology, among other weaknesses, has been charged with encouraging a radical separation between people and nature and with being inadequate to serve the protection of biodiversity. Sustainable development and "wise use" privatization of wildlands have been offered as alternatives to the Western wilderness concept. I review this wilderness debate and argue that critical distinctions between wildness and wilderness and self and other must be settled before alternatives can be considered. I look closely at arguments for sustainable development and argue that the limits on the human use of nature are discounted and technological management of wildlands is emphasized. I also argue that the "wise use" response to wilderness is a radically utilitarian option that does not contribute to evolving ideas of wilderness or sustainability and that replacing the sustainable development idea with sustainable landscape protection might better serve both wildness and human projects. Finally, I offer the ways of life of post-migratory ecosystem-based cultures as models of appropriate human behavior within a management framework of habitat protection for viable populations of all native species and conclude that our purpose in protecting wildness is not to preserve nature or to improve it, but rather to learn a sense of limits from it and to model culture after it. Grumbine is with the Sierra Institute, University of California, Santa Cruz. (EE)

Grunert, Suzanne C. Environmental Economics, Sustainable Development, "Green" Marketing, Eco-management, and the Like: A highly selective, partly annotated bibliography of research conducted in Europe and North America since the 70's. Aarhus, Denmark, CeSaM Working Paper No. 5 (Science Park Aarhus, Gustav Wieds Vej 10, DK-8000 Aarhus C, Denmark), 1995. 112 pages. This bibliography contains some 800 references on all kinds of aspects under the general heading "ecology and economy." It picks up the European references likely to be missed in American-based bibliographies. Books, anthologies, articles, working papers, and conference papers are listed. Most articles are provided with a summary and many books are annotated descriptively by the author. Also available as a database on Macintosh "Endnote." Grunert is in marketing at Odense University, Odense, Denmark. (Thanks to Martin Ishoy, Theology, University of Aarhus.)

Grunwald, Michael, "Departmental Differences Show Over ANWR Drilling," Washington Post (10/19/01): A1. ANWR debate rages on. Drilling for oil in Alaska's Arctic National Wildlife Refuge (ANWR) continues to be hotly contested. Proponents have recently been arguing for the drilling on national security grounds, as a way of lessening the U.S.'s dependence on foreign oil. Opponents of ANWR drilling argue that even if proponents are right that there is a 2-3 year U.S. supply of oil there (rather than the 6 month supply the opponents claim), the oil won't be available for years. Opponents also argue that raising automobile fuel efficiency standards would save us more oil overall and sooner. At recent Congressional hearings, U.S. Interior Secretary Gale Norton was accused by opponents of slanting her testimony about whether or not drilling would affect the Porcupine Caribou Herd which uses ANWR's coastal plain (where the oil is) to calve. Norton had asked Interior's own Fish and Wildlife Service for information on this issue and then selected only that part of their report that suited her pro-drilling purposes. She also cited a peer-review caribou study that concluded oil development would have no impact on the caribou.

Opponents argued that the study was funded by BP Exploration (British Petroleum is one of the companies hoping to drill in ANWR). Given the conflicting studies, it seems reasonable to assume that we do not know how significantly the Porcupine Herd would be affected by oil development. But this uncertainty can itself be seen as a reason to forgo this development. Alaska's Gwich'in Indians continue to hunt this herd as part of a largely subsistence way of life. Significant disturbance of these caribou would threaten their cultural survival. Even a small chance of causing cultural genocide would seem to be enough to prohibit an optional activity of this sort. For a helpful discussion of the ANWR debate, see Sandra Hinchman, "Endangered Species, Endangered Culture: Native Resistance to Industrializing the Arctic" paper given at Seventh World Wilderness Congress, November 2-8, 2001, Port Elizabeth, South Africa. Paper available from Hinchman at shinchman@stlawu.edu. Hinchman is Professor of Government at St. Lawrence University in Canton, New York. (v.12,#4)

Grutter, Theo, Dancing with Mosquitoes: To Liberate the Mind from Humanism--A Way to Green the Mind. New York: Vantage Press, 2000. Introduced as a "non-scholarly, eclectic piece of writing, which has turned quite unplanned into some rather unconventional research into the roots of ecology," by the author, who adds that "all my income to support our family for the last 35 years has come from a few years logging and then from fishing." "It has been slow for me to bring my activity at sea into harmony with my thoughts. ... Some ideas, though, only make sense when one becomes accustomed to stepping out of the bewitching circle humanism draws around itself" (pp. xvii-xviii). (v.11,#3)

Gruzalski, Bart. Review of Ethics of Consumption. Edited by David A. Crocker and Toby Linden. Environmental Ethics 22(2000):329-332.

Gruzalski, Bart. "Gandhi's Contributions to Environmental Thought and Action." Vinay Lal raises doubts about Gandhi's status as an environmentalist but argues that Gandhi had "a profoundly ecological view of life." I take issue with Lal's claims and, to set the record straight, describe Gandhi's contributions to environmental thought and action. When we look at the aims of contemporary environmental spokespersons and activists, Gandhian themes are dominant. Gandhian biocentrism and Gandhi's recommendation not to harm even nonsentient life unnecessarily are familiar in contemporary environmental thinking. Gandhian non-violence is both a technique of environmental activists and, for some, one of the constituents of the world for which they struggle. Gandhi emphasized simple living, an important theme for many who are concerned about looming ecological crises. Taking a broader perspective, Gandhi criticized what we today call globalization and encouraged, in its place, the decentralization of economic activities. Gandhi's emphasis on decentralization and local economic self-reliance led to the Chipko movement in India. Gandhi's emphasis on small-scale economies, on self-reliant communities, and on appropriate technology paved the way for the "small is beautiful" approach. Gandhi's recommendation that we live in self-reliant rural communities, if implemented, would significantly decrease that consumption which is causing climate change and straining the capacity of the planet. Environmental Ethics 24(2002):227-242. (EE)

Guehlstorf, Nicholas P., "Understanding the Scope of Farmer Perceptions of Risk: Considering Farmer Opinions on the Use of Genetically Modified (GM) Crops as a Stakeholder Voice in Policy," *Journal of Agricultural and Environmental Ethics* 21(2008):541-558. In the beginning, policy debates between critics and advocates of genetically modified (GM) crops focused on scientifically determined risks. Ten years later, the argument between environmentalists or consumers and regulators or industry has changed into a discussion about the implementation of more democratic policymaking about GM farming. A notable omission from the political debate about food biotechnology in the United States, however, is the opinion of farmers who cultivate the GM crops. Policymakers should value practical knowledge based on experiences from farmers, not only scientific industry reports or consumer product opinions. This project uses in-depth interviews to create an original mail survey that uses the practical discourse of farmers in order to explore the relationship of farmer attitudes and GM agriculture. Although national research indicates that larger yields are the most common reason for GM adoption, qualitative information suggest that the potential of GM crops to increase revenue per acre does not truly reflect all the concerns of modern farmers. For example, farmers who use GM seeds indicate that they constantly question the social impacts of their agricultural practices. As such, GM policies should be restructured as a political rationalization of both economic modeling and political theory because this research suggests that farmers' business decisions are utility calculations that consider economics without ignoring environmental and political contexts. Farmers' concerns about non-economic risks suggest that they need more information about GM crops and that governmental policies should respond to their interests, as they are more democratic or pluralistic than industry or consumer arguments. The author is in the Political Science Department and Environmental Sciences Program, Southern Illinois University Edwardsville, Edwardsville, IL.

Guelke, Jeanne Kay. Review of *The Natural History of the Bible: An Environmental Exploration of the Hebrew Scriptures*. By Daniel Hillel. *Environmental Ethics* 29(2007):91-93. (EE)

Guelke, Jeanne Kay. "Looking for Jesus in Christian Environmental Ethics." *Environmental Ethics* 26(2004):115-134. Jesus' teachings on neighborliness, frugality, support for the poor, and nonviolence should become more central to Christian environmental ethics. His action-oriented teachings do not explicitly mention nature, yet should have a beneficial collateral effect on environments when practiced by Christian communities. This issue affects Christian economics, simple causality models of environmental beliefs and impacts, and "love of nature" theology. (EE)

Guevara, Sergio and Javier Laborde. "The Landscape Approach: Designing New Reserves for Protection of Biological and Cultural Diversity in Latin America." *Environmental Ethics* 30(2008):251-262. One of the greatest challenges for Latin America and the Caribbean, the most biologically and culturally diverse region in the world, is to halt the loss of species caused by habitat destruction and land degradation. Up to now, setting aside protected natural areas is considered the most effective alternative to conserve biodiversity. Protected areas, however, are under increasing assault by agricultural, silvicultural, and industrial development that surround and isolate them, reducing their habitat quality at the landscape scale. Among the different types of protected areas that have been proposed, biosphere reserves stand out for their attempt to compatibilize social development and conservation. Their management is the most amenable to integration of natural and human disturbance, inclusion of traditional management techniques, and participation by social and economic sectors in the administration. Biosphere reserves have proliferated all over the world, and today there are 531 of them located in 105 countries, where they protect vast ecological and cultural diversity. Even though the design of biosphere reserves is based on the landscape concept, it has yet to take into account ecosystem scales, possible long-term effects of disturbances, and better integrate and give higher consideration to the knowledge and experience of numerous ethnic groups that live within them. However, doing so requires a transformation of the

function of the core, buffer, and transition areas. The current design of biosphere reserves is centripetal because the main function of the buffer zone is to protect biodiversity in the core. We propose a centrifugal model, where biodiversity of the core spreads freely toward the area of greater human influence with the buffer zone functioning as a connector. This connectivity can promote land-use practices that are in alignment with both ecosystems functioning and biodiversity conservation in natural, semi-natural, urban and industrial landscapes. (EE)

Guha, Ramachandra, The Unquiet Woods: Ecological Change and Peasant Resistance in the Himalaya. Berkeley: University of California Press, 1989, 1990. 214 pages. Domination and resistance in the forests of the Himalayas, scientific forestry and the alienation of humans from nature, rebellion and protest against commercial forestry over the decades of this century, the Chipko movement. "Third World capitalism, then (seen in such commercial forestry), is a gross caricature of European capitalism, reproducing and intensifying its worst features without holding out the promise of a better tomorrow" (p. 195). "From an ecological perspective, therefore, peasant movements like Chipko are not merely a defense of the little community and its values, but also an affirmation of a way of life more harmoniously adjusted with natural processes" (p. 196). Guha is with the Nehru Memorial Museum and Library in New Delhi.

Guha, Ramachandra, "Radical American Environmentalism and Wilderness Preservation: A Third World Critique," Environmental Ethics 11(1989):71-83. Criticism of the basic tenets of deep ecology in their application to Third World policies, but the argument rests on equating deep ecology with "wilderness preservation." The Third World is still trapped in the framework of anthropocentric use-values for nature. (Katz, Bibl # 2)

Guha, Ramachandra, "The Authoritarian Biologist and The Arrogance of Anti-Humanism: Wildlife Conservation in the Third World," The Ecologist 27(no. 1, January/February 1997):14-20. "Five major groups together fuel the movement for wildlife conservation in the Third World. The first are city-dwellers and foreign tourists who season their lives a week or a month at a time with sojourns in 'the wild'. Their motive is straightforward: pleasure and fun. The second group comprises ruling elites who view the protection of species, the tiger in India, for instance, as central to the retention or enhancement of national prestige. Spurring on this process is a third group, international conservation organizations, such as the International Union for Conservation and Nature (IUCN) and the Worldwide Fund for Nature (WWF), which work to 'educate' people and politicians to the virtues of biological conservation. A fourth group consists of functionaries of the state Forest of Wildlife Service which is mandated by law to control the parks. While some of these officials are inspired by a love of nature, the majority--at least in India--are often motivated by the power and benefits (overseas trips, for example) that come with the job.

The final group are biologists, who believe in wilderness and species preservation for the sake of 'science'.

These five groups tend to be united in their hostility to the farmers, herders, swiddeners and hunters who have lived in the 'wild' from well before it became a 'park' or 'sanctuary'. They regard these human communities as having a destructive effect on the environment, their forms of livelihood aiding the destruction of species and contributing to soil erosion, habitat simplification, and worse. Their feelings are often expressed in strongly pejorative language."

"Wildlife conservation programs in the Third World have all too often been premised on an antipathy to human beings. ... This prejudice against people is leading to new forms of oppression and conflict. Biologists, who seek to preserve wilderness for the sake of 'science', have been a major force in fomenting such prejudice." Guha is a historian in Bangalore, India.

Guha, Ramachandra. "Radical American Environmentalism and Wilderness Preservation: A Third World Critique." *Environmental Ethics* 11(1989):71-83. (EE) I present a Third World critique of the trend in American environmentalism known as deep ecology, analyzing each of deep ecology's central tenets: the distinction between anthropocentrism and biocentrism, the focus on wilderness preservation, the invocation of Eastern traditions, and the belief that it represents the most radical trend within environmentalism. I argue that the anthropocentrism/biocentrism distinction is of little use in understanding the dynamics of environmental degradation, that the implementation of the wilderness agenda is causing serious deprivation in the Third World, that the deep ecologist's interpretation of Eastern traditions is highly selective, and that in other cultural contexts (e.g., West Germany and India) radical environmentalism manifests itself quite differently, with a far greater emphasis on equity and the integration of ecological concerns with livelihood and work. I conclude that despite its claims to universality, deep ecology is firmly rooted in American environmental and cultural history and is inappropriate when applied to the Third World. Guha is at the Centre for Ecological Sciences, Indian Institute of Science, Bangalore, India. (EE)

Guha, Ramachandra. *How Much Should a Person Consume? Environmentalism in India and the United States*. Berkeley: University of California Press, 2006. Environmental philosophy in India is "agrarian," contrasted with "wilderness" in the U.S. Guha wants an inclusive "social ecology" framework that goes beyond both "partisan ideologies" to a richer understanding of controversies over large dams, state forests, wildlife reserves and conservation.

Guichard, Frederic; Levin, Simon A; Hastings, Alan; Siegel, David, "Toward a Dynamic Metacommunity Approach to Marine Reserve Theory", *BioScience* 54(no.11, November 2004):1003-1011(9). Coastal habitats have recently received much attention from policymakers, but marine reserve theory still needs to integrate across scales, from local dynamics of communities to biogeographic patterns of species distribution, recognizing coastal ecosystems as complex adaptive systems in which local processes and anthropogenic disturbances can result in large-scale biological changes. We present a theoretical framework that provides a new perspective on the science underlying the design of marine reserve networks. Coastal marine systems may be usefully considered as metacommunities in which propagules are exchanged among components, and in which the persistence of one species depends on that of others. Our results suggest that the large-scale distribution of marine species can be dynamic and can result from local ecological processes. We discuss the potential implications of these findings for marine reserve design and the need for long-term monitoring programs to validate predictions from metacommunity models. Only through an integrated and dynamic global perspective can scientists and managers achieve the underlying goals of marine conservation.

Jones, and Carlos Nobre. "Tropical Forests and Climate Policy." Science Vol. 316, no. 5827 (18 May 2007): 985-86. New science underscores the value of a climate policy initiative to reduce emissions from tropical deforestation. Tropical deforestation released about 1.5 billion metric tons of carbon to the atmosphere annually throughout the 1990s, accounting for almost 20% of anthropogenic emissions. Drought-induced tree mortality, logging, and fire may double such emissions in the near future.

Gunderson, Lance H., Holling, C. S., Light, Stephen S., eds. Barriers and Bridges to the Renewal of Ecosystems and Institutions. New York: Columbia University Press, 1996. 593pp. \$52.50 cloth. Continuing a series on adaptive environmental management, the authors review the management histories in the New Brunswick forests, the Everglades, the Chesapeake Bay, the Columbia River, the Great Lakes, and the Baltic Sea, demonstrating how people and ecosystems coevolve. In addition, contributors from the social sciences suggest broad critical strategies for surmounting barriers and renewing damaged ecosystems. (v7,#4)

Gunewardena, Nandini, and Mark Schuller, eds. *Capitalizing on Catastrophe: Neoliberal Strategies in Disaster Reconstruction*. Walnut Creek, CA: AltMira Press, 2008. An international group of scholars and professionals critically examine how local communities around the world have prepared for and responded to recent cataclysms. The book's principal focus is the increasing trend to rely on the private sector to deal with natural disasters and other forms of large-scale devastation, from hurricanes and tsunamis to civil wars and industrial accidents. Called "disaster capitalism" by its critics, the tendency to contract private interests to solve massive, urgent public problems may be inevitable but is extremely problematic - especially with respect to peoples who need help the most. Can private relief groups give the highest priority to potential and actual victims of large disasters, for example, if that means devoting

fewer resources to protecting tourism and other profitable industries?

Gunn, Alastair S. "Traditional Ethics and the Moral Status of Animals." Environmental Ethics 5(1983):133-54. Most philosophical discussion of the moral status of animals takes place within a context of traditional ethics. I argue that the conceptual apparatus of utilitarianism and rights theory is historically and logically tied to an individualistic, atomistic concept of society. The liberal-democratic tradition is thus an unsuitable framework for understanding, analyzing, and solving environmental problems, including the moral status of animals. Concepts such as stewardship or trusteeship are more appropriate for the development of an environmental ethic. Gunn is at the Philosophy Dept., University of Waikato, Hamilton, New Zealand. (EE)

Gunn, Alastair S. "Why Should We Care about Rare Species?" Environmental Ethics 2(1980):17-37. Concern for the fate of rare species leads us to ask why the extermination of species is wrong. No satisfactory account can be given in terms of animal rights, and a speciesist perspective can yield at best only a case for preservation of those species which enough people happen to care about. An attempt is made to analyze the concept of rarity, and its relation to value. Finally, it is suggested that the problem can be resolved only in terms of an environmental ethic, according to which the existence of each species, and of ecological wholes, is held to have intrinsic value. Gunn is at the Philosophy Dept., University of Waikato, Hamilton, New Zealand. (EE)

Gunn, Alastair S. "The Restoration of Species and Natural Environments." Environmental Ethics 13(1991):291-310. My aims in this article are threefold. First, I evaluate attempts to drive a wedge between the human and the natural in order to show that destroyed natural environments and extinct species cannot be restored; next, I examine the analogy between aesthetic value and the value of natural environments; and finally, I suggest briefly a different set of analogies with such human associations as families and cultures. My tentative conclusion is that while the recreation of extinct species may be logically impossible, the restoration of natural environments raises only (formidable, no doubt) technical difficulties. Opponents of destructive developments which do not exterminate species, therefore, had better look elsewhere, rather than relying on the claim that restoration is logically impossible. Gunn is in the department of philosophy, University of Waikato, Hamilton, New Zealand. (EE)

Gunn, Alastair S., McCallig, Carolyn, "Environmental Values and Environmental Law in New Zealand," Ethics and the Environment 2(1997):103-119. We examine the relation between environmental ethics and environmental law, focusing on the New Zealand Resource Management Act 1991. This is a comprehensive and philosophically grounded statute that was the first of its kind in the world. We analyze key concepts in the law including sustainability, resources, stewardship, natural character, and intrinsic law, which we try to resolve from a "weak anthropocentric" position. Gunn is on the faculty in philosophy, McCallig a graduate student, at the University of Waikato, Hamilton, New Zealand. (E&E)

Gunn, Alastair S. "Rethinking Communities: Environmental Ethics in an Urbanized World." Environmental Ethics 20(1998):341-60. Humans have largely transformed the natural environment and there is scarcely an area of the world which has not been affected by human activity. Human domination of the environment, in particular by the creation of infrastructure, urbanization, and conversion to agriculture, has mostly proceeded in an unplanned and frequently destructive manner. Almost fifty percent of humans already live in cities and this proportion will continue to grow. However, issues of urbanization are little addressed in the environmental philosophical literature. I explore community and sustainability in an urban context, drawing on the work of the landscape architect Ian McHarg who, I argue, may have more to offer an urbanized world than iconic figures such as Aldo Leopold. Gunn is in

philosophy, University of Waikato, Hamilton, New Zealand. (EE)

Gunn, Alastair S., and Tudhope, Kelly A., "The Report of the (New Zealand) Royal Commission on Genetically Modified Organisms: Ethical, Cultural and Spiritual Issues of Field Release," Organic NZ, September/October 2002, pp. 12-13. "We think the Commission's recommendations are wrong because it didn't give enough weight to ethical and cultural concerns, and underestimated risks. Furthermore, it derives conclusions that are inconsistent with both the general principles that it praises and with much of the material submitted to it, and advocates a dangerous experiment that carries serious risk of irreversible harm." "We think any field release is undesirable, because of the environmental and cultural risks and potential loss of intrinsic value." "The Report is a bit of a puzzle because someone reading it might almost imagine that the first half was written by staff from the Department of Conservation and the second half by the Business Roundtable." Gunn is in philosophy, University of Waikato. Tudhope is a law/philosophy student at the University of Waikato, New Zealand. (v.13,#4)

Gunn, Alastair S. Book Review of Ethics and the Built Environment. Edited by Warwick Fox. Environmental Ethics 26(2004):217-220. (EE)

Gunn, Alastair S., "Environmental Ethics and Trophy Hunting," Ethics and the Environment 6(no. 1, 2001):68-95. In the environmental literature, there is a spectrum of views on hunting. At one end is the view that hunting is justified only for self protection and for food, where no other reasonable alternative is available. Most writers also agree that hunting is sometimes justified in order to protect endangered species and threatened ecosystems where destructive species have been introduced or natural predators have been exterminated. Others accept hunting as part of cultural tradition or for the psychological well being of the hunter, sometimes extended to include recreational hunting when practiced according to "sporting" rules. Nowhere in the literature, so far as I am aware, is hunting for fun, for the enjoyment of killing, or for the acquisition of trophies defended. However I argue that trophy hunting is essential in parts of Africa for the survival of both people and wildlife. Gunn is in philosophy, University of Waikato, Hamilton, New Zealand. (E&E)

Gunn, Alastair S. Review of Toward a Transpersonal Ecology: Developing New Foundations for Environmentalism. By Warwick Fox. Environmental Ethics 15(1993):181-83.

Gunn, Alastair S. "Environmental Ethics and Tropical Rain Forests: Should Greens Have Standing?" Environmental Ethics 16(1994):21-41. Almost everyone in the developed world wants the logging of tropical rain forests to stop. Like Antarctica, they are said to be much too important and much too valuable to be utilized just for development and are said to be part of a global heritage. However, it is not that simple. People in the developing world consider our criticisms to be ill-informed, patronizing, and self-serving. We are seen as having "dirty hands." They hold that we neither have nor deserve moral standing as critics until we change our trade policies, rhetoric, and extravagant lifestyles. Gunn is in the department of philosophy, University of Waikato, Hamilton, New Zealand. (EE)

Gunn, Alastair S., and P. Aare Vesilind, Environmental Ethics for Engineers. Chelsea, Michigan: Lewis, 1986. Pp. 153. A good introductory textbook on environmental issues and engineering practice. Although designed for the specific use of engineering undergraduates, it would be useful in any course on moral problems. There is a brief introduction to the ethical dimensions of engineering and to the theoretical arguments in environmental ethics. The remainder of the book is a collection of essays and environmental disaster case-studies. The philosophy essays include Aldo Leopold's "The Land Ethic," Garrett Hardin's "Tragedy of the Commons," and excerpts from Christopher Stone's "Should Trees Have Standing?" These classics in the field of environmental ethics are all accessible to the nonspecialist. (Katz, Bibl # 1)

Gunster, Shane, "'You Belong Outside': Advertising, Nature, and the SUV," Ethics and the Environment 9(no. 2, 2004):4-32. Images of nature are among the most common signifiers of utopia in commercial discourse, tirelessly making the case that a certain commodity or brand will enable an escape from the malaise and drudgery of urban existence. The invocation of natural themes has been especially prominent in the marketing and promotion of sport utility vehicles over the past decade. Speeding through deserts and jungles, fording raging rivers, and even scaling the heights of Mt. Everest, the SUV is routinely depicted in the most spectacular and remote natural locations. These fanciful themes now attract the scorn of many who draw upon them to underscore the rather glaring contradictions between how these vehicles are marketed and how they are actually used: the irony of using pristine images of a hyper-pure nature to motivate the use of a product that consumes excessive amounts of natural resources and emits high levels of pollutants lies at the core of the growing public backlash against the SUV. While generally sympathetic to this critical perspective, I argue that we need to think through the role of nature in constructing the promotional field of these vehicles in a more rigorous fashion that is often the case. Gunster teaches advertising and media studies at Simon Fraser University in Burnaby, British Columbia. (E&E)

Gustafson, James M. A Sense of the Divine: The Natural Environment from a Theocentric Perspective. Cleveland, OH: Pilgrim Press, 1994. Chapter 1: For many people there is at least an implicit "sense of the divine" in nature that often underlies other reasons for concern for the environment. A theocentric perspective provides one way to describe and understand this sense of the divine and in turn to elicit it more deeply and fully. Chapter 2: Human accountability and the conflicts of purpose that lead inevitably to ambiguous moral choices, and perhaps in some cases to tragic ones. Moral ambiguity pervades medical and economic choices as well, but in ecological issues it has particular dimensions, as humans intervene with the natural world. The task of ethics is to reduce, if not eliminate it, but success can only be limited. Chapter 3: An ideal-typology of different stances of responsibility toward nature, with some discussion of the religious or theological correlates of each type. One type, humans as participants in nature, is appropriate to a theocentric perspective. Chapter 4: Some relevant academic disciplines, those that contribute to discussion and resolutions of environmental policy. Can the disciplinary arcs be closed to form an integrated view of the environment? This is our human responsibility, but premature closure is likely to lead to policies and actions that are directed by limited values and interests. The parts seldom, if ever, come into a whole harmonious equilibrium. Nothing can exist independently; everything exists interdependently. Anything which exists in a proper condition is in equilibrium with everything else. Well balanced treatment. Anyone who thinks that theologians do not do their homework in other disciplines should read this book. Gustafson is in theological ethics at Emory University and the author of Ethics from a Theocentric Perspective, 2 vols, University of Chicago Press, 1981 and 1984, a widely discussed work, which he here elaborates in the direction of ecological ethics.

Gutierrez, Jorge L.; Jones, Clive G., "Physical Ecosystem Engineers as Agents of Biogeochemical Heterogeneity," BioScience 56 (no.3, March 2006): 227-236 (10). Physical ecosystem engineers are organisms that physically modify the abiotic environment. They can affect biogeochemical processing by changing the availability of resources for microbes (e.g., carbon, nutrients) or by changing abiotic conditions affecting microbial process rates (e.g., soil moisture or temperature). The consequences of physical ecosystem engineering for biogeochemical processes can be predicted by considering the resources or abiotic conditions that limit or promote a reaction, and the effect of physical ecosystem engineering on these resources or abiotic conditions via the control they exert on material flows and heat transfer.

Hadjilambrinos, Constantine. "An Egalitarian Response to Utilitarian Analysis of Long-Lived Pollution: The Case of High-Level Radioactive Waste." Environmental Ethics 22(2000):43-62. High-level radioactive waste is not fundamentally different from all other pollutants having long life spans in the biosphere. Nevertheless, its management has been treated differently by policy makers in the United States as well as most other nations, who have chosen permanent isolation from the biosphere as the objective of high-level radioactive waste disposal policy. This policy is to be attained by burial deep within stable geologic formations. The fundamental justification for this policy choice has been provided by utilitarian ethical analysis. It, in turn, has been supported primarily by assumptions, based on expert opinion, about the ultimate safety of geologic disposal. However, close analysis of these assumptions reveals that the safety of geologic disposal is highly uncertain. Moreover, factors such as the possibility for human intrusion into repository sites make it impossible to even guess at the ultimate consequences of any policy choice pertaining to the final disposal of high-level radioactive waste. I discuss why utilitarian ethics cannot be used to determine the efficacy of such policy choices. I then develop an alternative approach which is based on egalitarian principles of procedure and utilize it to explore policy proposals which promote justice and equity in the high-level radioactive waste management process. I argue that there are two possible solutions to the high-level radioactive waste dilemma: (1) an amendment to the U.S. Constitution to create an institution to advocate on behalf of the interests of future generations and (2) the active management of the waste in monitored, retrievable facilities in perpetuity. Of these two options, I find maintaining surveillance and vigilance in perpetuity to safeguard high-level radioactive waste to be preferable because of its political and ethical efficacy. (EE)

Hadley, John, "Critique of Callicott's Biosocial Moral Theory," Ethics and the Environment 12(no. 1, 2007):67-78. J. Baird Callicott's claim to have unified environmentalism and animal liberation should be rejected by holists and liberationists. By making relations of intimacy necessary for moral considerability, Callicott excludes from the moral community nonhuman animals unable to engage in intimate relations due to the circumstances of their confinement. By failing to afford moral protection to animals in factory farms and research laboratories, Callicott's biosocial moral theory falls short of meeting a basic moral demand of liberationists. Moreover, were Callicott to include factory farm and research animals inside the moral community by affording them universal or non-communitarian rights, his theory would fall foul of environmentalists who seek to promote ecosystem stability and integrity via therapeutic hunting. If factory farm and research animals can have rights irrespective of their particular

circumstances, then so can free-roaming animals from overabundant and exotic species. Hadley is at Charles Stuart University, New South Wales, Australia.

Hadley, John. "Nonhuman Animal Property: Reconciling Environmentalism and Animal Rights." *Journal of Social Philosophy* Vol. 36, no. 3 (2005): 305-15. From the article: "I will broaden the debate about property in environmental ethics by suggesting a different way that private ownership could help protect natural areas and the nonhuman animals that inhabit them. As a check on human intervention in natural areas that is destructive of habitat, a nonhuman animal property rights regime (structured along the lines I suggest) can secure the maintenance of ecosystem stability and ensure the vital interests of nonhuman animals are respected. The key moral demands of environmentalism and animal rights can be met by extending the scope of property ownership beyond the human species to other sentient animals that have a vital interest in using natural goods" (p. 305).

Hailwood, Simon A. "The Value of Nature's Otherness." Environmental Values 9(2000):353-372. ABSTRACT: Environmentalist philosophers often paint a holistic picture, stressing such things as the continuity of humanity with wider nature and our membership of the 'natural community'. The implication seems to be that a non-anthropocentric philosophy requires that we strongly identify ourselves with nature and therefore that we downplay any human/non-human distinction. An alternative view, I think more interesting and plausible, stresses the distinction between humanity and a nature valued precisely for its otherness. In this article I discuss some of its main elements, and some of the difficulties involved with keeping nature's otherness in focus. Firstly (in sections 1-5), I try to clarify what I take to be the otherness-based position by distinguishing it from the apparently similar views of John Passmore, Robert Elliott and Keekok Lee, and some opposed holistic views, especially of J. Baird Callicott. Then, in the second half of the article (sections 6-7), I argue that if nature is valued in virtue of its otherness, this value is best thought of as an extrinsic, final and objective good, where 'objectivity' is a 'method of understanding', in Thomas Nagel's sense. Although I give some reasons for preferring an otherness account to certain alternative positions, I make no overall attempt to 'prove' that nature is valuable for its otherness. My aim is to show that, if it is, then this seems the best way to understand that value. KEYWORDS: Otherness, nature, holism, intrinsic value, objectivism.

Hailwood, Simon. "Landscape, Nature, and Neopragmatism." *Environmental Ethics* 29(2007):131-149. A popular if controversial claim, and troublesome for environmental philosophy, ethics, and related disciplines, is that "there is no such thing as nature." The social constructionist version of this claim makes it difficult to draw a distinction between human and nonhuman nature. In response, first, the concept of landscape can be helpful in drawing this distinction. Second, taking this approach is consistent with at least one interpretation of Richard Rorty's neopragmatism. Constructionism can be divided into two forms: moderate and radical. Moderate constructionism allows the landscape/nature distinction; radical constructionism excludes it. Rorty's claim that independent reality is "the world well lost" apparently marks him as a radical constructionist. Nevertheless, the core doctrines of his neopragmatism constitute a moderate constructionism, allowing the nature/landscape distinction. The real problem is

Rorty's anthropocentric instrumentalist characterization of pragmatic justification. Left in place, it renders neopragmatism a form of radical social constructionism. Redescribing the terms of justification in less anthropocentric instrumentalist terms is consistent with the anti-Platonist core of neopragmatism. Thus redescribed, neopragmatism is fully consistent with the landscape/nature distinction. Anthropocentric instrumentalism, not social constructionism per se, is the problem. (EE)

Hains, Chris, Development and Conservation Issues in Africa, M. A. thesis, Colorado State University, summer 2001. The thesis evaluates ways in which development and nature conservation, both valuable goals, can be achieved in Africa. Objections to prevailing forms of development, that they do not succeed for pragmatic reasons and that Western ideas about development and conservation are misplaced impositions on Africa. Although improving the lives of humans and conserving nature can be difficult, there is adequate evidence that these goals are attainable. Nor is it always necessary to favor human centered development over the conservation of nature. Some conservation projects, even if they do not focus on improving the welfare of humans, can still be justified. Hains, who spent two years in the Peace Corps in Lesotho (South Africa), is now in a Ph.D. program in African history, University of Minnesota. (v.12,#3)

Halberg, N., Kristensen, E. Steen, Kristensen, I. Sillebak. "Nitrogen Turnover on Organic and Conventional Mixed Farms." Journal of Agricultural and Environmental Ethics 8(1995):30-51. Separate focus on crop fertilization or feeding practices inadequately describes nitrogen (N) loss from mixed dairy farms because of (1) interaction between animal and crop production and between the production system and the manager, and (2) uncertainties of herd N production and crop N utilization. Therefore a systems approach was used to study N turnover and N efficiency on 16 conventional and 14 organic private

Danish farms with mixed animal (dairy) and crop production. There were significant differences in N surplus at the farm level (242 kg. N/ha. vs. 124 kg. N/ha. on conventional and organic dairy farms respectively) with a correlation between stocking rate and N surplus. N efficiency was calculated as the output of N in animal products divided by the net N import in fodder, manure and fertilizer. N turnover in herd and individual crops calculated on selected farms showed differences in organic and conventional crop N utilization. This is explained via a discussion of the rationality behind the current way of planning the "optimum fertilizer application" in conventional agriculture. The concept of marginal N efficiency is insufficient for correcting problems of N loss from dairy farms. Substantial reductions in N loss from conventional mixed dairy farms is probably unlikely without lower production intensity. The concept of mean farm unit N efficiency might be a way to describe the relation between production and N loss to facilitate regulation. This concept is linked to differing goals of agricultural development - i.e. intensification and separation vs. extensification and integration. It is discussed how studies in private farms - using organic farms as selected critical cases - can demonstrate possibilities for balancing production and environmental concern. (JAEE)

Haldane, John, "Admiring the High Mountains: the Aesthetics of Environment". Environmental Values 3(1994):97-106. In recent years there has been a dramatic expansion of the range of studies, policy directives and initiatives concerned with the environment. For the most part these are unphilosophical, pragmatic responses to perceived threats of pollution and other forms of environmental degradation. However, they invariably presuppose certain conceptual and normative commitments, and the examination and evaluation of these has been a major concern of environmental philosophy. To date the primary focus of interest has been on ethical and political values, but there is a developing sense of the need to consider issues relating to the aesthetics of environment. After outlining a general philosophical structure for understanding the nature of aesthetic experience, its objects and values, a little known theory - that of Aquinas - is explained and defended. Hale, Benjamin, "The Moral Considerability of Invasive Transgenic Animals," Journal of Agricultural and Environmental Ethics 19(2006):337-366. The term moral considerability refers to the question of whether a being or set of beings is worthy of moral consideration. Moral considerability is most readily afforded to those beings that demonstrate the clearest relationship to rational humans, though many have also argued for and against the moral considerability of species, ecosystems, and "lesser" animals. Among these arguments there are at least two positions: "environmentalist" positions that tend to emphasize the systemic relations between species, and "liberationist" positions that tend to emphasize the attributes or welfare of a particular individual organism. Already, this classic conflict provides for some challenging theoretical clashes between environmentalists and animal liberationists. The question of moral considerability is complicated, however, by recent developments in genetic engineering. Some animals, like pigs and fish, have been genetically modified by humans to grow organs that can then be transplanted into humans. If environmental arguments for the moral consideration of species are correct, then we are released from our obligations to morally consider those animals that we have genetically modified, since they are by their nature always an "invader species." If, instead, the welfare of the animal is of penultimate importance, then there is a case for strengthening the moral considerability of GM animals over "naturally-occurring" animals, since they bear a closer relationship to humans. This would appear to be an intractable problem, a "bad marriage," as Mark Sagoff once proposed. This paper argues that the

case of invasive transgenic animals exposes weaknesses in this classic conflict, and particularly, in the framing of this conflict. To remedy this framing problem, this paper argues for a reconceptualization of the term "moral considerability," instead urging a strong distinction between moral considerability, moral relevance, and moral significance. Keywords: considerability - genetic engineering - invader species - moral status - transgenic animals. Hale is in the Philosophy Department, University of Colorado, Boulder. (JAEE)

Haley, David, "Species nova [to see anew]: Art as ecology," Ethics and the Environment 8(no. 1, 2003):143-150. A call for integrating art as a necessary contribution to ecological intervention. How artists engage uncertainty and how art may be used to develop new ways of seeing and 'drawing'. This is art for evolutionary survival. Haley is with Manchester Metropolitan University's Environmental Arts Practice Research Unit. (E&E)

Haley, Michael, and Clayton, Anthony, "The Role of NGOs in Environmental Policy Failures in a Developing Country: The Mismanagement of Jamaica's Coral Reefs," Environmental Values 12(2003): 29-54. Recent years have seen a proliferation of non-governmental organisations (NGOs) with a mission to help redress various social and environmental problems, but the effectiveness of these organisations in carrying out their stated goals is rarely assessed or critically examined. It has become increasingly clear, however, that these organisations vary greatly in their level of competence and professionalism. Many of them are ineffective, and in some cases they may even exacerbate the problems they set out to solve. These difficulties are based upon flawed assumptions about how civil society can correct social ills, and about how institutions that are intermediate between the individual and the state can carry out effective change.

To illustrate these points with an environmental example, we present the case of Jamaica's coral reefs, which have been under stress for decades. Both the causes of reef degradation and the solutions to these problems can be clearly outlined. Many well-intentioned organisations and individuals have been involved in the attempt to stem or reverse the damage, and significant funding has been channelled through these agencies. In spite of this, there has been no documented improvement in the condition of the reefs, apart from some natural regeneration that owed nothing whatever to any human activity. (EV)

Halfmann, Jost. "Community and Life-Chances: Risk Movements in the United States and Germany." Environmental Values 8(1999):177-197. ABSTRACT: The connotations attached to the concept of "risk" have changed over the last several decades. In particular, the image of risk, at least in the world's most economically advanced countries, has turned from predominantly positive to highly critical. A sociological look at this historic change reveals the emergence of a plurality of risk definitions that can be attributed to different risk cultures. We can distinguish risk cultures by their proximity to the dominant social practice of risk taking; namely risk cultures belong either to the centre or the periphery of society. Social movements that resist risky technologies are examples of a peripheral risk culture. Due to a certain concept of social community their perception of risk differs fundamentally from that of the centre. In addition, cultural variation across countries leads to different representations of risk-avoidance in social movements. This contribution illustrates these differences by comparing the American and German anti-nuclear movements. KEYWORDS: Community, life-chances, risk movements, risk cultures. Hall, David C., Simeon Ehui, and Christopher Delgado, "The Livestock Revolution, Food Safety, and Small-Scale Farmers: Why They Matter to Us All," Journal of Agricultural and Environmental Ethics 17(2004):424-444. Global consumption, production, and trade of livestock products have increased rapidly in the last two decades and are expected to continue. At the same time, safety concerns regarding human and animal disease associated with livestock products are increasing. Efforts to increase public health safety standards aimed at legitimately reducing the risks of human and animal disease have focused internationally on standards to regulate the movement of livestock products. There is concern, though, that measures to regulate these standards internationally, such as the WTO SPS measures that in part aim to open international markets, may marginalize small-scale poor producers. The cycle of poverty they are trying to escape through livestock production may, in fact, widen, leading to increased global poverty, malnutrition, and disease. Developing and developed nations alike should be concerned with public and private efforts to address appropriate food safety policies to reduce the likelihood of this effect. Analysis of the impact on small-scale livestock farmers is needed as well as solutions that consider joint public and private sector initiatives. Keywords: development, food policy, food safety, international trade, Livestock Revolution, poverty alleviation, SPS measures. The authors are with the Food and Agriculture Organization of the United Nations, Rome. (JAEE)

Hall, W. David, "Does Creation Equal Nature? Confronting the Christian Confusion about Ecology and Cosmology," Journal of the American Academy of Religion 73(2005):781-812. Much of the recent interest in the idea of creation among Christian writers has suffered from a fundamental misconception that creation and nature are equivalent or nearly equivalent terms. While the two are not unrelated, they are nonetheless distinct. Two particular areas where this misconception appears are the movement that calls itself "creation science" and certain strains known as "theology of nature" or "ecological theology." One promising way to distinguish the ideas of creation and nature is by introducing Hans-Georg Gadamer's understanding of world (Welt) and environment (Unwelt) as a hermeneutical construct. This allows us initially to distinguish world as creation from world as nature. Environment is characterized by immediacy; world is a mediated reality. Once the lines of division have been laid out, Gadamer's ideas provide the groundwork for a more critical reintroduction of ideas of creation and nature that offers productive possibilities for an ecological ethic as well as a general ethic. Hall is in religion, Centre College, Danville, KY.

Hallen, Patsy, "The art of impurity," Ethics and the Environment 8(no. 1, 2003):57-60. I was taken aback when I received a request from the West Australian government to write a response to the question, "What Is The Ethical Foundation For Planning A More Sustainable Future?" My first reaction was: Does not every one want a future? And doesn't this necessarily mean a commitment to sustainability? Would not everyone earnestly want a more sustainable future? No sooner had I received this request than I became ill and in my fever-induced reveries I penned imaginary responses. I wrote: "The Ethical Foundation of Sustainability is 'Joy' or 'Life' or 'An Ethic of Flourishing'." Hallen is in philosophy, Murdoch University, Perth, Australia. (E&E)

Haller, Stephen F., and James Gerrie, "The Role of Science in Public Policy: Higher Reason, or Reason for Hire?" Journal of Agricultural and Environmental Ethics 20(2007):139-165. The traditional vision of the role science should play in policy making is of a two stage process of scientists first finding out the facts, and then policy makers making a decision about what to do about them. We argue that this two stage process is a fiction and that a distinction must be drawn between pure science and science in the service of public policy. When science is transferred into the policy realm, its claims to truth get undermined because we must abandon the open-ended nature of scientific inquiry. When we move from the sphere of science to the sphere of policy, we pick an arbitrary point in the open-ended scientific process, and ask our experts to give us the answer. The choice of the endpoint, however, must always be arbitrary and determined by non-scientific factors. Thus, the two stages in the model of first finding the facts, and then making a decision about what to do, cannot be clearly separated. The second stage clearly affects the first. This conclusion will have implications about existing scientific policy institutions. For example, we advocate that the environmental assessment process be radically overhauled, or perhaps even let go. It will be our position that ultimately a better model for the involvement of scientists in public policy debates is that of being participants in particular interest groups ("hired guns"), rather than as supposedly unbiased consultants to decision-makers. Keywords: environment - environmental assessment - philosophy - public participation - public policy - science. Haller is at Contemporary

Studies and Philosophy, Wilfrid Laurier University, Brantford, ON, Canada.. Gerrie is at Department of Philosophy and Religious Studies, Cape Breton University, Sydney, NS, Canada.

Haller, Stephen. "A Prudential Argument for Precaution under Uncertainty and High Risk." Ethics and the Environment 5(2000):175-190. ABSTRACT: Some models of global systems predict catastrophe if certain human activities continue. Unfortunately, these models are less than certain. Despite this uncertainty, some argue for precaution on the grounds that we have an ethical obligation to avoid catastrophe, whatever the practical costs. There is much to say in favor of ethical arguments. Still, some people will remain unmoved by them. Using arguments parallel to those of Pascal and James, I will argue that there are prudential reasons for precaution that should convince those not already persuaded by ethical arguments. This argument for precaution does not presuppose that we are convinced by the uncertain models that predict catastrophe.

Hallman, David G. Caring for Creation: The Environmental Crisis, a Canadian Call to Action. Wood Lake Books, Box 700, Winfield, B.C. VOH 2CO, Canada. (EE v.12,#1)

Hallman, Max O. "Nietzsche's Environmental Ethics." Environmental Ethics 13(1991):99-125. I argue that Nietzsche's thinking, contrary to the interpretation of Martin Heidegger, is compatible with an ecologically oriented, environmentally concerned philosophizing. In support of this contention, I show that Nietzsche's critique of traditional Western thinking closely parallels the critique of this tradition by environmentalist writers such as Lynn White, Jr. I also show that one of the principal thrusts of Nietzsche's own philosophizing consists of the attempt to overcome the kind of thinking that has provided a theoretical foundation for the technological control and exploitation of the natural world. Finally, I show that Nietzsche's notion of the will to power, at least in several of its formulations, has certain affinities to the ecosystem approach of modern ecologists. Hallman is at the Humanities Division, Merced College, Merced, CA. (EE)

Halsey, Mark, "Environmental Visions: Deleuze and the Modalities of Nature," Ethics and the Environment 9(no. 2, 2004):33-64. This article examines the role of vision in the construction of Nature. How nature is 'seen' is inextricably tied to how such a space is named, traversed, and experienced at particular moments. A key contention is that the lens of modernity has for too long adversely impacted what it is possible to see, say, do, and feel with respect to Nature.

The force of this statement is borne out with reference to orthodox envisionings of forest conflict in Australia. The article concludes by calling for an environmental ethic(s) which puts into critical relief the discursive, trajectory, and affective dimensions of vision. Halsey is in law, Flinders University of South Australia. (E&E)

Halsey, Mark. *Deleuze and Environmental Damage: Violence of the Text*. Burlington, VT: Ashgate Publishing, 2006. Halsey uses a detailed analysis of forest conflict in Australia and Giles Deleuze's thought to present a post-structuralist critique of the problems associated with modernist accounts of environmental harm and regulation. He argues that the traditional variables of gender, race, and political economy need to be recast in light of four key modalities—vision, speed, lexicon, and effect—to develop a new ethics for categorizing and regulating nature and for challenging criminologists, cultural theorists, sociologists, and others to reconsider what it is possible to say and do about environmental problems.

Hamilton, KG Andrew, "Bugs Reveal an Extensive, Long-Lost Northern Tallgrass Prairie", BioScience 55 (no.1, January 2005):49-59(11). Only tiny remnants of unplowed natural meadows remain in the eastern part of the state of North Dakota, and in Canada from eastern Saskatchewan to Manitoba. Those west of Lake Manitoba and the Red River Valley are characterized by their distinctive fauna of insects, principally leafhoppers and planthoppers (Homoptera: Auchenorrhyncha). These true bugs include hundreds of species invariably associated with North American grasslands. The distributions of those with the most limited dispersal abilities reflect long-term patterns of dominance and contiguity of native grass stands in prairies. These bug distributions indicate that bluestem-dominated grasslands in Canada, which usually are under 0.5 meter (20 inches) in height, are equivalent to tallgrass prairie from Illinois. This prairie once extended as much as 400 kilometers (250 miles) northwest of its previously known distribution. These bugs help differentiate tallgrass prairie from sites in southwestern Manitoba and adjacent North Dakota, which are more arid, and from sites east of Lake Manitoba and southward in the Red River Valley, which were formerly oak savanna.

Hamilton, Martha, "Global Warming Gets a 2nd Look," Washington Post (3/3/98): C1; and Warrick, Joby, "White House Predicts Low Cost for Pact on Warming," Washington Post (3/4/98): A1. Oil industry executives begin to acknowledge global warming. A growing number of major oil company executives are admitting that fossil fuels may be changing the world's climate and they are suggesting their companies are beginning to focus on the problem of reducing greenhouse-gas emissions. A managing director of Royal Dutch Shell said: "I find myself increasingly persuaded that a climate effect may be occurring." A British Petroleum spokesperson said at Stanford University that oil industry executives are beginning to move beyond denial and acknowledge the role of fossil fuels in the buildup of greenhouse gases. Part of the motivation may be that this shift in attitude will make it easier for these companies to influence critical details about how to accomplish the reduction in greenhouse gases agreed to in the Kyoto climate treaty. The oil companies were part of the Global Climate Coalition which fought the Kyoto treaty by trying to debunk the science behind it and by warning of economic ruin. On a related note, the Clinton Administration has released its predictions of costs for American consumers of U.S. implementation of the Kyoto treaty. The projections are for a 4-cents to 6-cents per gallon increase in the price of gasoline and a 3 to 5 percent increase in the cost of electricity, fuel oil, and natural gas. (v9,#2)

Hammit, William E., and William M. Rutlin, "Achieved Privacy in Wilderness," International Journal of Wilderness 3(no. 1, 1997):18-24. Opportunities for solitude and privacy are characteristics supposed to distinguish wilderness from other types of outdoor recreation. Whether this is so, in a study in Elliott Rock Wilderness in the southeastern U.S. Hammit teaches forest resources at Clemson University, Rutlin was a graduate research assistant in the study. (v8,#2)

Hammond, Allen, Which World? Scenarios for the 21st Century. Washington, DC: Island Press, 1998. There are three scenarios: (1) the market world: a new golden age of prosperity, (2) the fortress world of instability of violence, and (3) the transformed world: changing the human endeavor. Hammond favors the latter, where fundamental social and political changes give rise to enlightened policies and voluntary actions that direct and supplement market forces. This is already beginning as attested by the greening of global corporations, altered government policies, the rise of citizen groups, and a new age of philanthropy. This study is a joint venture of the Brookings Institution, the Santa Fe Institute, and the World Resources Institute. Hammond was formerly editor-in-chief of the annual World Resources. (v.9,#4)

Hammond, John L. "Wilderness and Heritage Values." Environmental Ethics 7(1985):165-70. Some proponents of the preservation of American wilderness--for example Aldo Leopold--have argued in terms of the role of wilderness in forming and maintaining a set of distinctive national character traits. I examine and defend the value judgment implicit in Leopold's argument. The value of one's cultural

heritage is, I contend, as important and valid as other familiar goods appealed to in defense of social policy. Hammond is in the department of philosophy, Portland State University, Portland, OR. (EE)

Hammond, Michael and Holland, Alan. "Ecosystem Health: Some Prognostications". Environmental Values 4(1995):283-286. The provenance of the contributors to this special issue fairly reflects the origins of the concept of ecosystem health. It was born and raised in the new world. It is too early to judge how it will be received in the old world where it has as yet barely established a foothold. (EV)

Hampicke, Ulrich, "Ethics and Economics of Conservation," Biological Conservation 67(1994):219-231. Nature can be valued in its own right or as an instrument for the benefit of humankind. The second valuation, although less fundamental from a philosophical point of view, is sufficient to substantiate conservation as a moral duty. The harm done to future generations in burdening them with an ecologically impoverished world cannot be justified by the moral standards of a civilized society when we consider the fact that conservation costs are not excessive. Even from a purely anthropocentric point of view it is logically impossible to assess the full monetary value of an irreversibly lost ecological asset. However, monetarization is possible within a limited scope. Many such studies in Germany show that conservation costs are low in terms of the benefits received. A good summary of the mix of philosophy, ethics, and economics, with applications to Germany. Hampicke is in the Department of Economics, Gesamthochschule/Universität Kassel, Germany. (v5,#4)

Hampshire, K; Bell, S; Wallace, G; Stepukonis, F, "'Real' Poachers and Predators: Shades of Meaning in Local Understandings of Threats to Fisheries", Society and Natural Resources 17 (no.4, 2004): 305-318(14).

Hampson, Fen Osler, and Reppy, Judith. Earthly Goods: Environmental Change and Social Justice. Ithaca, New York: Cornell University Press, 1996. 263pp. The book covers four major themes. The first series of authors lay out alternative frameworks for evaluating social justice from different philosophical perspectives:

--Henry Shue, "Environmental Change and the Varieties of Justice"

--Wendy Donner, "Inherent Value and Moral Standing in Environmental Change," see separate entry.

--Will Kymlicka, "Concepts of Community and Social Justice"

--Iain Wallace and David Knight, "Societies in Space and Place"

The second series of authors discuss the role of the state and of substate actors in the international policies of the environment:

--Christian Reus-Smit, "The Normative Structure of International Society"

--Joseph Camilleri, "Impoverishment and the National State"

--Smitu Kothari, "Social Movements, Ecology and Justice"

Third, two authors take up the question of the role of science in framing the debate on global environmental change and the use of science as a resource by various actors in actual negotiations:

--Sheila Jasanoff, "Science and Norms in Global Environmental Regimes"

--Steven Yearley, "Campaigning and Critique: Public-Interest Groups and Environmental Change"

Finally:

--Peter Timmerman, "Breathing Room: Negotiations on Climate Change" The last article provides an account of international negotiations in which the themes of the previous chapters are developed and used to argue for the centrality of social justice in reaching desirable outcomes. Hampson teaches politics at Carleton University; Reppy is in science and technology studies at Cornell University. (v8,#1)

Hampson, Fen Osler, Reppy, Judith, eds. Earthly Goods: Environmental Change and Social Justice. Ithaca, New York: Cornell University Press, 1996. 272pp. \$16.95 paper. The role of science and global change. Western science does not provide morally disinterested solutions to environmental problems. The authors discuss the role of state and substate actors in the international politics of the environment,

and then use accounts of actual negotiations to argue for the centrality of social justice in reaching desirable and equitable agreements. (v7,#4)

Hancocks, David, A Different Nature: The Paradoxical World of Zoos and their Uncertain Nature. Berkeley: University of California Press, 2001. Hancocks, with his eye sharpened by biophilia, sees the good, the bad, and the downright ugly. "We should not accept zoos as they are." Hancocks wants to reinvent the zoo. Zoos evolved from pure spectacle, to lip-service dedication to science, and finally, in the best cases, to research and conservation. But, with a few exceptions, "zoos can immediately stop degrading the word 'conservation' by employing it so irresponsibly." Hancocks is the director of Australia's Open Range Zoo at Werribee. Hanna, Susan, "Property Rights and Biodiversity," Encyclopedia of Biodiversity 4: 891-899. Property rights to natural resources define privileges and responsibilities in the use of environmental goods and services. They specify the way people are to behave toward one another as they use environmental resources. This chapter describes the form and function of property rights in general and discusses the relation of property rights to biodiversity in particular. This discussion summarizes what is known about the potential and limitations of property rights to protect biodiversity. It also examines the considerable uncertainty that exists with respect to the design of property rights for biodiversity protection. (v.11,#4)

Hansen, Lene, Egon Noe and Katrine Hojring, "Nature and Nature Values in Organic Agriculture. An Analysis of Contested Concepts and Values Among Different Actors in Organic Farming," Journal of Agricultural and Environmental Ethics 19(2006):147-168. The relationship between agriculture and nature is a central issue in the current agricultural debate. Organic Farming has ambitions and a special potential in relation to nature. Consideration for nature is part of the guiding principals of organic farming and many organic farmers are committed to protecting natural qualities. However, the issue of nature, landscape, and land use is not straightforward. Nature is an ambiguous concept that involves multiple interests and actors reaching far beyond farmers. The Danish research project Nature Quality in Organic Farming has investigated the relationship between nature and organic farming. This article will focus on an expert workshop held in connection with the project that investigates the way different actors conceptualize nature. Farmers, scientists, and non-governmental organizations came together to discuss their experiences of nature and expectations of organic agriculture. From this interaction, it was clear that nature is a contested notion. Different understandings of nature exist within the three groups and there is disagreement as to whether emphasis should be given to biological qualities, production values, or

experiential and aesthetic perspectives. This complexity provides a challenge to organic farming as well as to the implementation of nature considerations in general. It illustrates an underlying battle for the right to define nature and nature quality and essentially decide what organic farmers should work towards. We argue that successful implementation requires organic farmers to carefully consider what expectations they wish to meet. Optimally it is dependent on a dialog between stakeholder interest groups that allows for multivocality and pluralism. Keywords: actors - discourse - implementation - multivocality - nature-nature quality - organic farming - values. The authors are in the Department of Agroecology, Danish Institute of Agricultural Sciences Research Centre Foulum, Tjele, Denmark.

Haque, M. Shamsul. "Environmental Discourse and Sustainable Development: Linkages and Limitations." Ethics and the Environment 5(2000):3-22.

ABSTRACT: In the development field, one of the major shortcomings of mainstream development theories and models is their relative indifference toward environmental concerns. However, the worsening environmental catastrophes and the growing environmental consciousness led to the emergence of a new model of development known as 11 sustainable development. " The proponents of sustainable development tend to explore the environmental costs of development activities, prescribe environment-friendly policies, suggest institutional and legal measures for environmental protection, and publicize the principles of sustainability through international forums and publications. Despite this

recognition of environment-development relationship, the model of sustainable development suffers from certain serious shortcomings that need to be addressed. This article begins with a brief discussion on various forms of environmental challenges to development, followed by an analysis of how the model of sustainable development articulates the environment-development linkages in both practical and intellectual terms. The final section of the paper critically examines the major limitations of the model in dealing with the environmental question, and makes some suggestions in this regard. (E&E)

Federal Government Orders Dam Removed. Malakoff, David A., "Agency Says Dam Should Come Down," Science 277(1997):762. For the first time in history, the federal government ordered the removal of a private hydroelectric dam that the owner wanted to continue to operate. The 160 year old Edwards Dam on the Kennebec River in Maine was ordered removed in order to restore the habitat of nine species of migrating fish. The dam was an easy target: The electricity it generates is 3 times more expensive than the going rate in Maine, it irrigates no fields and does not control floods, and it employs only four people. The owner claims the federal government is taking private property without just compensation and will appeal the removal order. A change of law in 1986 requires the federal agency which licenses dams to balance environmental and recreation costs against the benefits of dams. There is increasing pressure across the country for removal of dams, some of which are far bigger and provide far more power than the Edwards dam. Hydropower provides 14 percent of the nation's electricity supply. (v.8,#4)

Harden, Blaine, "Hatchery Salmon Plan Announced; Fish to Be Used in Stream Rebuilding," Washington

Post, May 29, 2004, p. A03. The Bush Administration plans to consider hatchery-bred salmon that join and survive among stream-bred populations in determining whether the species merits listing under the Endangered Species Act. In 2001 a U.S. District Court decision delisted Oregon coast coho salmon because genetically similar hatchery-bred fish had joined and increased the wild population. "Aelsea Valley Alliance v. Hardin, Garrett, Living Within Limits: Ecology, Economics, and Population Taboos. New York: Oxford University Press, 1993. 288 pages. \$ 25.00. The planet's ability to support life is finite, and the exponential growth of the human population is exceeding that capacity. For various reasons, the population crisis appears to have become a taboo subject. Compassion and altruism are dangerous. Competing survivors on a lifeboat should do whatever it takes to keep others from climbing aboard the lifeboat. Stop all philanthropy and immigration, which is "the promiscuous sharing of wealth." Demand that poor nations with growing populations sink or swim by themselves. Hardin demolishes the validity of unecological technological optimism, an uncritical faith in progress, mindless fixation on growth, and the appealing but finally destructive sentimentalism of Western philanthropic impulses. This is social Darwinism at its best and worst: hard-headed and hard-hearted. But Hardin does not address questions of distributive justice (except to group them with philanthropic charity) and his world of ecological limits might not have as much scarcity as he fears, if the productivity of the good earth were more justly distributed, and if the escalating desires of those living so luxuriously on the lifeboats could be curtailed. Hardin is professor emeritus of human ecology at the University of California, Santa Barbara, and the author of "The Tragedy of the Commons," an influential essay in Science in 1968. (v4,#4)

Death metaphors were used primarily by those with an anthropocentric point of view and found in media reports of the fires. Birth metaphors were used primarily by those with a biocentric point of view and found in environmentalists' discussions of the fires. "Archetypal metaphors remain prominent in contemporary public discourse... such metaphors have an inventional quality ... and archetypal metaphors are especially powerful rhetorical devices in the context of a perceived crisis." (v.8,#4)

Hare, R.M., "Moral Reasoning about the Environment." Journal of Applied Philosophy 4 no. 1 (1987): 3-14. A strange article by one of the leading moral philosophers of our time. Hare tries to cover too much ground in ten pages: the purpose of applied philosophy, the basis of moral obligations to nature and the practical and political problems involved in environmental planning. His substantive position is that only beings that are sentient can have interests and hence, moral value. If we use a kind of Golden Rule when judging or evaluating entities, we find that it makes no sense to consider what happens to us if we are trees. This seems to show a surprising lack of imagination on the part of Hare. Nonetheless, he has advice that all environmental philosophers--particularly Deep Ecologists--should take to heart: "Philosophers are above all students of arguments" (p. 3). (Katz, Bibl # 1)

Hargrove, Eugene C., ed. The Animal Rights/Environmental Ethics Debate: The Environmental Perspective. Reviewed in Environmental Ethics 15(1993):279-82.

Hargrove, Eugene, ed., Religion and Environmental Crisis. Athens, GA: University of Georgia, 1986. Pp. xxi, 222. This collection of essays is meant as a companion volume to William Blackstone's Philosophy and Environmental Crisis (University of Georgia, 1974), which was the first anthology in the field of environmental philosophy. The essays here herald a new era in the relationship between religious thought and environmental issues; they offer constructive proposals, and thus move beyond a mere discussion/refutation of Lynn White's attack on Christianity as the root cause of the environmental crisis. All major western religious perspectives are considered, as well as Islam and Taoism (these latter two essays were originally published in Environmental Ethics.) Of particular interest are the historical studies by J. Donald Hughes, "Pan: Environmental Ethics in Classical Polytheism" (pp. 7-24), and Gerard Reed, "A Native American Environmental Ethic: A Homily on Black Elk" (pp.25-37). Both essays show that pre-Christian "pagan" religions had a much closer relationship with Nature as a sacred place than does modern Christianity. Three essays consider the application of Christianity to the current environmental crisis. Robert H. Ayers, "Christian Realism and Environmental Ethics" (pp. 154-171), adopts the realistic position of Niebuhr that man's relationship to nature is dialectical: he is both part of nature and superior to it. John B. Cobb, Jr., "Christian Existence in a World of Limits" (pp. 171-187), finds this "Christian realism" inadequate as it stands; it needs to be supplemented by an "eschatological attitude," the hope for an ideal future in Christ. Jay McDaniel, "Christianity and the Need for New Vision" (pp. 188-212), argues for a radical restructuring of the metaphysical basis of Christian thought on the model of Whitehead's process philosophy. Essays by Jonathan Helfand, Susan Power Bratton, and Martin LaBar explore biblical sources for appropriate environmental attitudes. Good bibliography. (Katz, Bibl # 1)

Hargrove, Eugene C. and J. Baird Callicott. "Leopold's `Means and Ends in Wild Life Management.'" Environmental Ethics 12(1990):333-37. Leopold's lecture at Beloit College provides an important glimpse into his conversion from a philosophy of prudent scientific resource management to a land ethic and aesthetic. Leopold here advocates natural regulation not simply because of his growing concern that invasive management principles are limited, but also because of aesthetic considerations that were independent of his instrumental or "utilitarian" training at the Yale Forest School and in the U. S. Forest Service. The lecture is helpful in correcting an unfortunate misreading of Leopold's famous essay, "The Land Ethic," according to which the land ethic is interpreted as being based primarily on human welfare and self-interest. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. Hargrove is in the department of philosophy, University of North Texas, Denton, Texas. (EE)

Hargrove, Eugene, ed., Beyond Spaceship Earth: Environmental Ethics and the Solar System. San Francisco: Sierra Club Books, 1986. Pp. xv, 336. Most of the essays in this interdisciplinary collection were presented at a conference at the University of Georgia in June 1985. There are essays on the technical aspects of space exploration, the military and political use of space, and the ethical considerations of human activity in the solar system. Six essays are overtly philosophical. William K. Hartmann, "Space Exploration and Environmental Issues" (pp. 119-139), serves as a starting point for most of the discussions. This essay originally appeared in Environmental Ethics 6 (1984): 227-239. Hartmann's view is optimistic: he sees space exploration as providing utilitarian benefits: the development of natural resources, the possibility of alternative experimental cultures, an insurance against human self-destruction on earth. In "Wilderness and Space" (pp. 183-210), Paul F. Uhler and William P. Bishop suggest frameworks for the political and legal protection of wilderness in space, as well as for the management of earthly wilderness from extraterrestrial vantage points. Frank B. Golley, "Environmental Ethics and Extraterrestrial Ecosystems" (pp. 211-226), considers the possibility and the motivations for building extraterrestrial space colonies. Golley suggests that the building of space colonies is a "faustian" task, for man will be attempting to recreate nature for his own purposes in a hostile environment (p. 224). Of the greatest philosophical interest are three essays by Norman Daniels, Holmes Rolston, and J. Baird Callicott. Daniels, "Consent to Risk in Space" (pp. 277-290), considers the problems in structuring long term space missions so that the participants can maintain their autonomy in making significant mission decisions. Daniels concludes that this is a serious political question: the creation of adequate political structures for long term (multi-generational) missions. Rolston, in "The Preservation of Natural Value in the Solar System" (pp. 140-182), continues his development of a non-anthropocentric system of natural value. He considers Nature as "projective," i.e., as a source of creativity that produces projects of "formed integrity." He develops a list of normative rules based on the principle that "Humans ought to preserve projects of formed integrity, wherever found" (p. 170). Callicott, "Moral Considerability and Extraterrestrial Life" (pp. 227-259), argues that Leopold's land ethic is inadequate for the preservation of extraterrestrial life: such a life, if it exists, would lie outside earth ecosystems. But obligations to

extraterrestrial life could be justified on the basis of a Schweitzerian model of "reverence-for-all life." Callicott then suggests that we bring together these two diverse value systems under a theory of "weak anthropocentrism" popularized by Bryan Norton. Certain uses of natural entities "transform" and "ennoble" human life (p. 252). Callicott thinks it obvious that the discovery of extraterrestrial life would transform and ennoble the human vision of itself. (Katz, Bibl # 1)

Hargrove, Eugene C. "The Historical Foundations of American Environmental Attitudes." Environmental Ethics 1(1979):209-40. John Passmore has claimed that American environmental attitudes are incompatible with Western traditions and Western civilization: they arose out of a Romantic transvaluation of values in the eighteenth and nineteenth centuries, and today are defensible only in terms of antiscientific nature mysticism and Oriental religions. I argue that these attitudes developed out of an intricate interplay between Western science and art over the last three centuries, and are, therefore, of Western, not Eastern, origin. Moreover, they are a part of scientific and aesthetic changes so broad and fundamental that, despite Passmore's prediction that they are unlikely to survive into the twenty-first century, they cannot be regarded lightly as a passing fad, and probably have already found a permanent place in Western thought and values. Hargrove, Eugene C. "Anglo-American Land Use Attitudes." Environmental Ethics 2(1980):121-48. Environmentalists in the United States are often confronted by rural landowners who feel that they have the right to do whatever they want with their land regardless of the consequences for other human beings or of the damage to the environment. This attitude is traced from its origins in ancient German and Saxon land use practices into the political writings of Thomas Jefferson where it was fused together with John Locke's theory of property. This view of land and property rights was most influential in the late nineteenth century after the passage of the Homestead Act in 1862 when it was used in the arguments opposing national parks and nature preservation. Today it remains a formidable obstacle to planning and zoning in rural areas, despite unstated underlying assumptions which are either outdated or false. Hargrove is in the department of philosophy, University of New Mexico, Albuquerque, NM. (EE)

Hargrove, Eugene C., ed., The Animal Rights/Environmental Ethics Debate: The Environmental Perspective. Albany: State University of New York Press, 1992. 273 pages. Paper. A collection of eleven essays documenting the history of the animal rights/environmental ethics debate. Papers by

Richard A. Watson, J. Baird Callicott, Bryan G. Norton, Paul W. Taylor, Mary Midgley, Eugene C. Hargrove, Mary Anne Warren, Mary Midgley, and John A. Fisher, all previously published but here gathered together for the first time. A wide variety of views is represented, which provides significant amounts of material for classroom discussion. Hargrove, Eugene C., Foundations of Environmental Ethics. Englewood Cliffs, NJ: Prentice Hall, 1989. Pp. x, 229. Hargrove, as editor of the journal Environmental Ethics, is arguably the most influential philosopher in the field--yet this is the first book length statement of his position. The status of the author alone would be enough to make this an important contribution to the field of environmental philosophy, but this is also a powerful argument concerning the roots of environmental ideals in the Western tradition. In part, the book answers John Passmore's contention that a philosophy of nature preservation is alien or marginal to Western culture. The rebuttal of Passmore involves a far-ranging investigation of the intellectual history of environmental attitudes, both those that have inhibited environmental thought (notably, the Western philosophical tradition of idealism, and the Anglo-Saxon conception of property rights) and those that have supported preservationist intuitions (primarily, scientific and aesthetic ideals). Based on the demonstrated existence of Western aesthetic intuitions, Hargrove presents a detailed argument for the ethical foundations of preservationist policy. He argues against the justification of preservation based on "therapeutic nihilism:" since we cannot know precisely how nature operates, we should let it alone. This prevalent ideal is expressed as Barry Commoner's "third law" of ecology: "nature knows best," a platitude which Hargrove convincingly rejects. The central problem with the preservationist argument based on therapeutic nihilism is that its force is contingent upon developments in the science of ecology and technological power. If we do learn more about nature, so that we may re-create it, then the preservationist position loses its support. Much better, argues Hargrove, to ground environmentalist policy on the aesthetic values we discover in nature. Nature, even more than human-created art, is beautiful and good; and moral agents have an obligation to preserve and promote goodness in the world. Nature is beautiful (and hence good) by its mere existence; Hargrove thus terms his argument "an ontological argument" for environmental ethics. Central to this discussion is an excellent analysis of the attempted human domination of nature and how this destroys the beauty and autonomy of the natural world. "The authenticity of nature arises out of the fact that its existence precedes its essence" (p. 195). In sum, Hargrove attempts to create a middle position between an instrumental justification for environmental policy based on human interests and an intrinsic justification based on the direct consideration of non-human value. The aesthetic value for nature is an intrinsic value for humans; it thus is intrinsic and anthropocentric, with a secure place in Western traditions. The central problem for Hargrove's argument is the claim that aesthetic value is intrinsic and not instrumental. Although he is careful to distinguish higher level aesthetic experience from the mere "consumption" of natural beauty, the possibility remains that any human interest in aesthetic experience is primarily (and exclusively) an instrumental good. Hargrove, Eugene C., "Foundations of Wildlife Protection Attitudes." Inquiry 30 (1987): 3-31. Interesting argument for wildlife preservation based on historical exegesis of attitudes toward species. Our wildlife preservation attitudes did not develop from the theory of evolution or the science of ecology but actually predate them. They are based on two earlier views uniformitarianism in geology, and the Linnaean standardization of species classification. Wildlife preservation attitudes are basically aesthetic, and rest on the instrumental value of species, not the intrinsic value of individual animals. This has important negative implications for the animal rights position or any kind of environmental individualism. (Katz, Bibl # 1)

Hargrove, Eugene C. "A Traditional and Multicultural Approach to *Environmental Ethics* at Primary and Secondary School Levels." *Environmental Ethics* 30(2008):263-271. Translating *Environmental Ethics* into something that can be taught at the primary and secondary school levels may never be feasible. In addition, what needs to be taught may vary in different cultures around the world. A good noncontroversial starting point may be to begin with the values that are often listed in the purpose statements of environmental laws. Teachers could teach the history of ideas behind those values and their relationship to environmental concern. This approach is needed as a counter to the value approach of modern economics which treats noneconomic values as meaningless expressions of personal emotion. Comparative value discussion can be used to clarify traditional values and in countries with indigenous populations with values originating in different histories of ideas, such as the values of the First Nation peoples in Canada and the Mapuche in Chile, which can be used to promote better understanding between major social groups.(EE)

Harlow, Elizabeth M. "The Human Face of Nature: Environmental Values and the Limits of Nonanthropocentrism." *Environmental Ethics* 14(1992):27-42. While some form of nonanthropocentrism is a defining feature of environmental ethics, there are at least four senses in which the value of nature might be said to be humanly independent, and these are often conflated. I argue that the strongest of these four (Rolston's "autonomous intrinsic value") may require classic ontological commitments which are no longer historically open to us. However, if we take seriously the language dependent view of nature suggested by post-Wittgensteinian epistemology, we find paradoxically that this kind of anthropocentrism can ground a genuine sense in which nature is valuable in its own right, yet as part of human good. In this context, Rolston's distinction between "autonomous intrinsic value" and "anthropogenic intrinsic value" becomes a distinction without a difference. Harlow is in the department of philosophy, Ryerson Polytechnic Institute, Toronto, Canada. (EE)

Harman, Jay R. "Notions of Self-Interest: Reflections on the Intersection between Contingency and Applied Environmental Ethics." *Environmental Ethics* 23(2001):377-389. If agents motivated only by self-interested reasons practice different degrees of ethical environmental behavior at least partly because they hold different notions of what is in their self-interest, then the nature of our self-interest conceptions is a central issue in environmental ethics. Unless set by biology, as seems unlikely from the evidence, the breadth of the individual self-interest conception we each develop must depend on the specific experiences we are each contingently exposed to in our lives. If nurturing a stronger environmental ethic within our society is a goal, if that ethic depends at least in part on how we individually conceive of our self-interest, and if the development of each of our self-interest conceptions responds contingently to input from others, then these reflections lead to normative considerations that reach beyond the standard ethical questions regarding how to act to others that concern, antecedently, whether to act at all. Why we ought to be concerned about the loss of diversity in both nature and culture. Insights from conservation biology, evolutionary theory, linguistics, geography, psychology, philosophy, and ethics. When more and more elemental differences are erased from the natural world and human societies, the field of possible experience becomes more constricted and our essential humanity becomes jeopardized. Harmon is Executive Director, The George Wright Society, Hancock, Michigan (a society dedicated to the protection, preservation, and management of cultural and national parks and reserves).

Harmon, David, Biodiversity and the Sacred: Some Insights for Preserving Cultural Diversity and Heritage," Museum International 55(no. 218, 2003):63-69. Nature has been sacred since the dawn of human consciousness, and there is today a broadening range of spirituality, often interfused with the secular, that cannot easily be characterized as "faith," but regards nature as sacred. The sacred is a bridge between nature and culture. Scientists are often offering responses to why save nature that make recourse to the idea of the sacred. Biologists call the creative process speciation, while theologians call it genesis, and they have very different explanations for it, but both have agreed that it is eminently valuable. Harmon is Executive Director, George Wright Society, an international professional association advancing the scientific and cultural values of protected natural areas and cultural sites.

Harris, Paul G., "Affluence, Poverty and Ecology: International Relations, and Sustainable Development," Ethics and the Environment 2(1997):121-138. Effective efforts to protect the global environment will require the willing cooperation of the world's poor. Persuading them to join international environmental agreements and to choose environmentally sustainable development requires substantial concessions from the affluent industrialized countries, including additional financial assistance and technology transfers. The affluent countries ought to provide such assistance to the world's poor for ethical reasons. Doing so would promote transnational distributive justice, which is defined here as a fair and equitable distribution among countries of benefits, burdens and decision making authority, in this case associated with transnational environmental relations. Conceptions of distributive justice examined include utilitarianism, human rights, causality/responsibility, impartiality, and principles derived from Kantian and Rawlsian ethics. Harris is a visiting research fellow at the Oxford Centre for the Environment, Ethics, and Society. (E&E)

Harris, Paul G., "'Getting Rich Is Glorious': Environmental Values in the People's Republic of China," Environmental Values 13(2004):145-165. Pollution and overuse of resources in China have profound implications for the Chinese people and the world. Globalisation may be partly to blame for this situation, but it is hardly the only explanation. China has been overusing its resources for centuries. Traditional values appear to offer environmentally benign guidance for China's economic development, but they are largely impotent in the face of now-pervasive values manifested in Western-style consumption. Government policies go some way toward addressing this problem, but what may be required is a new set of values that brings self-interest and environmental protection into common cause. Keywords: China, environment, consumption, globalisation, values. Harris is in politics and sociology, Lingnan University, Hong Kong. (EV)

Harris, Richard B., "Approaches to Conserving Vulnerable Wildlife in China: Does the Colour of Cat Matter--if it Catches Mice?," Environmental Values 5(1996):303-334. China's environmental problems are well known, but recently its record in the area of wildlife conservation, particularly with regard to endangered species, has come under scrutiny. Environmental values colour how we in the West view both China's past experience with wildlife and what strategies it should adopt to foster better conservation. Chinese have long taken a utilitarian view of wildlife, valuing species primarily as resources for man's use and only secondarily for other reasons. However, China has not developed institutions capable of sustaining the desired use of wildlife in the face of ever-growing demands. I suggest that Western criticisms of Chinese utilitarian attitudes are inappropriate, ineffective, and possibly counter-productive: deep-seated cultural mores change slowly. Instead, Westerners concerned with the fate of China's wildlife should assist the development of systems that act to channel demand for wildlife material benefits toward investment in conservation. Such systems will likely require devolution of considerable control to local levels, strengthening incentives to favour long- over short-term benefits, and--notwithstanding common Western attitudes--substantial consumptive use of wildlife. KEYWORDS: China, consumptive use, incentives, utilitarianism, wildlife conservation. (EV)

Harrison, Carolyn and Jacquelin Burgess. "Valuing Nature in Context: The Contribution of Common-good Approaches," Biodiversity and Conservation 9(no. 8, 2000):1115-1130. Abstract. We draw on a number of empirical studies undertaken in the UK to show how residents and farmers come to contest scientific approaches to valuing nature as the basis for adjudicating conflicts over protected natural areas. The findings of these studies suggest that a widening of the knowledge base on which the goals and practices of nature conservation are founded, and a more deliberative process of decision making about what nature is important locally, is required if effective conservation partnerships are to be sustained. We offer a common good approach to valuing nature as a means of addressing this problem. A common good approach is based on ethical and moral concerns about nature and expresses these values through a social and political process of consensus building. We illustrate how this common good approach can be used to prioritise issues in a Local Environment Agency Plan. When linked with a method of Stakeholder Decision Analysis this common good approach is capable of building coalitions and a measure of consensus between different interests. It achieves this through a transparent and deliberate process of debate and systematic analysis of values that makes explicit the foundation of different knowledge claims about nature. Key words: common good approaches, local knowledge, stakeholder analysis, valuing nature.

Harrison, Neil E., Constructing Sustainable Development. Albany, NY: State University of New York Press, 2000. Sustainable development proposals are at least incomplete or impractical and at worst dangerously misleading. The concept of sustainable development presents a problem for theorists and policy makers because it cannot be objectively defined and subjective understandings vary widely. For the capitalist, sustainable development is a problem of production efficiency and technological innovation; for the environmentalist, a more appropriate ethic is a necessity; and for the developing country policy maker, a more equitable distribution over resources is imperative. How sustainable development can be constructed from policy principles derived from ongoing adaptations to changes in values, beliefs, and scientific knowledge, and applied both in developed and developing countries. (v.13,#1)

Harrison, R. 1964. Animal machines. London: Vincent Stuart, 1964.

Harrison, RD, "Figs and the Diversity of Tropical Rainforests," BioScience 55 (no. 12, December 2005): 1053-1064. Ficus (Moraceae) is arguably one of the most important plant genera in lowland tropical rainforests. Pioneer attributes have endowed figs with tremendous evolutionary flexibility, while long range seed dispersal ensures that a high proportion of the regional species pool is represented in local assemblages. Large numbers of Ficus species are able to coexist because many are extremely rare as a result of limited recruitment opportunities, which limits competition. They are nevertheless able to breed at low densities because they possess an efficient, long range pollination system. These factors are likely to be important in the diversity of other plant groups in the tropics.

Harrison, Robert Pogue, Forests: The Shadow of Civilization. Chicago: University of Chicago Press, 1992. 288 pages. \$ 19.95. A study of how complicated with trees and woodlands the human outlooks and civil habits have been. A comprehensive, though selective, history of forests in the Western imagination. (v3,#2)

Harrison, Ruth, "Since Animal Machines", Journal of Agricultural and Environmental Ethics 6(1993): A brief overview of changes in the pattern of livestock farming since publication of Animal Machines in 1964 is presented. Some of the pressures leading to change - the Brambell Committee in Britain, parliamentary agriculture committee reports in Britain and the European Economic Community (EEC), the Council of Europe, the EEC - are mentioned, as are some of the actual legislative reforms achieved in Europe. Political, social and economic pressures on farmers to increase production through intensive systems of livestock farming are now being superceded in Europe by similar pressures on them to adopt "alternative" systems. A plea is made for governments everywhere to broaden their thinking on the future of livestock farming to bring into balance the demands of global food and feed, of the environment and of the welfare of the animals. Harrison is at 34 Holland Park Road, London W14 8LZ, England.

Jamieson, Dale, "Ethics and Animals: A Brief Review", Journal of Agricultural and Environmental Ethics 6(1993): This essay is a short exposition of the current state of the discussion regarding ethics and animals. The views of various proponents of animal rights and liberation are discussed, along with those of their critics. What emerges is that few moral philosophers today would defend the full extent of our current practices with regard to non-human animals. We have entered a new era in our concerns about animal welfare, and there will be no going back. Animals are now centrally located on the moral map. Ethology has played an important role in this shift, and animal welfare science is an important key to improving the lives of non-human animals and helping us to discharge our moral obligations to them. In these circumstances philosophy and animal welfare science must mutually inform each other. Jamieson is at the Center for Values and Social Policy, Department of Philosophy, University of Colorado, Boulder, CO 80309.

Property rights, organisms and communities, environmental values, with concluding discussion of two environmental problems that affect Long Island: nuclear energy and a safe water supply. (v3,#3)

Hart, Rob and Uwe Latacz-Lohmann. "The Indifference Curve, Motivation, and Morality in Contingent Valuation," Environmental Values 10(2001):225--242. Contingent valuation surveys have tended to yield results that seem to go contrary to what is standardly seen as "rational choice". We argue that some of the inconsistencies arise because bids for public environmental goods in contingent valuation surveys are often (at least partly) motivated by moral considerations and ethical beliefs. We analyse the expected

results of CV surveys given the existence of such ethical motivations, including the valuation of actions as well as states. It is found that we cannot expect bids made on this basis to reveal preferences which obey the rules commonly assumed in the theory of consumer choice. The two standard reactions to these anomalies have been to attack the validity of the method, or to urge greater rigour in survey design and application. By contrast, we conclude that the usefulness of the method for evaluating options concerning environmental public goods depends critically on the problem definition. The method should be used for the direct evaluation of realistic policy packages, rather than to try to extract abstract values for invaluable goods. The conclusion accords with current trends, including the move towards the use of deliberative methodologies. Keywords: Non-market valuation, contingent valuation, rational choice, utilitarianism. Rob Hart is at the Department of Economics, The Swedish University of Agricultural Sciences, Uppsala, Sweden. Uwe Latacz-Lohmann is at the Department of Land Economy, University of Cambridge, Cambridge, UK and the Agricultural and Resource Economics, University of Western Australia Nedlands, Perth Australia. Hart, Stuart L., "Beyond Greining: Strategies for a Sustainable World," Harvard Business Review 75(no. 1, Jan./Feb. 1997):66-76. In the 1960's and 1970's, corporations were in a state of denial about their impact on the environment. But today many companies have accepted their responsibility to prevent pollution. What they need to do now is help create a sustainable global economy. The drive toward sustainability is an absolute imperative for human survival. It also represents one of the biggest challenges--and opportunities--for individual companies in the history of commerce. Emerging economies cannot afford to repeat the mistakes of Western development. Hart teaches corporate strategy and directs the Corporate Environmental Management Program at the University of Michigan Business School. It is interesting to see an author like this taking his terminology from Vandana Shiva (p. 76). (v8,#1)

Hartley, Troy W. "Environmental Justice: An Environmental Civil Rights Value Acceptable to All World Views." Environmental Ethics 17(1995):277-289. In accordance with environmental injustice, sometimes called environmental racism, minority communities are disproportionately subjected to a higher level of environmental risk than other segments of society. Growing concern over unequal environmental risk and mounting evidence of both racial and economic injustices have led to a grassroots civil rights campaign called the environmental justice movement. The environmental ethics aspects of environmental injustice challenge narrow utilitarian views and promote Kantian rights and obligations. Nevertheless, an environmental justice value exists in all ethical world views, although it involves a concept of equitable distribution of environmental protection that has been lacking in environmental ethics discussion. Hartley is in natural resources and environment, University of Michigan. (EE)

Hartmann, William K. "Space Exploration and Environmental Issues." Environmental Ethics 6(1984):227-39. New discoveries about materials and solar energy raise the possibility of a long-term shift of mining, refining, and manufacturing from Earth's surface to locations outside Earth's ecosphere, allowing Earth to begin to relax back toward its natural state. A little-discussed ambivalence toward the potential of space exploration exists among environmentalists. One camp sees it as a human adventure that may allow a bold initiative to improve Earth; another camp shies away from "heavy technology" and thus distrusts efforts as massive as space exploration or utilization. Due to impending resource depletion on Earth, we may have only until the mid-twenty-first century to pursue the promising potential of space exploration to alleviate environmental problems of Earth. Subsequently, there may be too little industrial base to support vigorous exploration and exploitation of resources in space. Hartmann is at the Planetary Science Institute, Tucson, AZ. (EE)

Hartmann, William K., "Space Exploration and Environmental Issues," Environmental Ethics 6(1984):227-239. Can the exploration of outer space be discussed from the perspective of environmentalism? This essay surveys several relevant environmental arguments (e.g., obligations to future generations, survival) as they apply to space exploration and space wilderness preservation. (Katz, Bibl # 1)

Hartshorne, Charles. "The Rights of the Subhuman World." Environmental Ethics 1(1979):49-60. Hastings Center, The has issued a special supplement to the Hastings Center Report, May/June 1990, entitled "Animals, Science, and Ethics," edited by Strachan Donnelley and Kathleen Nolan. The report is the outcome of two years of deliberation, a Hastings Center project, "The Ethics of Animal Experimentation and Research," of which Donnelley and Nolan were co-directors. The project involved nearly two dozen physicians, philosophers, veterinarians, lawyers, and scientists involved in animal research, representatives of whom have written sections of the report. The Hastings report identifies itself

as occupying the "troubled middle," seeking to avoid the extremes of animal rights and of anthropocentrism. Among other conclusions: "We now face issues that lie beyond the suffering of individual animals, and we must weight the benefits of gaining certain kinds of knowledge against the entire range of consequences of research efforts. Seemingly innocuous scientific procedures may have negative effects on the target species as well as the ecosystem. In short, field research forces us to face directly the fact that humans are but a part of a complex system that needs many flourishing organisms if any are to survive." The Hastings Center is considering a further initiative, a three-year project, "Humans, Animals, and the Environment: Ethical Responsibilities and Decisionmaking." This project will investigate more intensively the destruction of ecosystems, atmospheric degradation, toxic wastes, wildlife and wildlife habitats, genetic diversity, species preservation, animal research in the wild, and the experimental use of endangered species. Hattingh, Johan, Willie van der Merwe, and Wilhelm Verwoerd, "Is Access to Electricity a Human Right?" Research paper prepared for Eskom (the South Africa electricity corporation) by the Unit for Environmental Ethics, University of Stellenbosch, Stellenbosch. February 1993. Is it possible to speak of access to electricity as a human right? If so, what are the practical implications for the generation, transmission, and distribution of electricity in South Africa. The authors provide preliminary background and a broad outline for further debate. (v6,#3)

Hattingh, Johan P., Ian Voges, Kobus Miller, Vilhelm Verwoerd, The Relationship between Ethics, Environment and Development: Guidelines for Policy Making in South Africa. A research report prepared for the Development Bank of South Africa by the Unit for Environmental Ethics, University of Stellenbosch, Stellenbosch. May 1994. 30 pages. At least the following values should inform policy making: Justice in the sense of fairness; development that expands people's functionings, capabilities, and freedoms; the environment has intrinsic value; an action is right if it preserves the beauty, integrity, and stability of the biotic community; it is right to exploit the environment for vital human purposes; it is wrong to over-exploit the environment because it has inherent worth and so doing will compromise the ability of future generations to meet their basic needs. Copies from Hattingh, address above. (v5,#2)

Hattingh, Johan, and Attfield, Robin, "Ecological Sustainability in a Developing Country such as South Africa? A Philosophical and Ethical Inquiry," International Journal of Human Rights 6 (no. 2, Summer 2002):65-92. "Although South Africa has adopted the notion of ecologically sustainable development not only as a human right entrenched in its Constitution, but also as one of its major policy objectives, there are major practical, conceptual, and ethical stumbling blocks impeding the achievement of this goal. In this article we investigate the conceptual and some of the ethical problems, including apparent conflicts with other pressing goals such as the alleviation of poverty. We conclude that the concept of ecologically sustainable development has a substantive core, and that radical reforms of human systems allow this right and goal to be reconciled with other human needs."

"Before we allow further destruction of nature, or what is left of nature, we should first reverse the unwise decisions of the past that made environmental destruction possible and 'inevitable' in the first place. We should not allow nature, or what is left of it, to pay the ultimate price for the unwise human decisions of the past. So we should rather focus on the human system to make it more efficient and effective, to make it more just and fair, to make it less exploitative of people and of nature. Nothing less is required by the path of development. Now, if this argument is sound, ... the conservation of nature and natural ecosystems need not be incompatible with human interests in survival" (p. 87). Hattingh is at the University of Stellenbosch, South Africa. Attfield is at the University of Wales, Cardiff. (v.13,#4)

Hattingh, Johan P., Willie L. van der Merwe, and Wilhelm J. Verwoerd, Is Access to Electricity a Human Right? A research paper compiled for Eskom (the leading South Africa Power Authority) by the Unit for Environmental Ethics, University of Stellenbosch. February 1993. Accepting that access to electricity is a human right in the sense of a basic need, there can be little disagreement about the importance of meeting this basic need within the context of a modern or modernizing society. The disagreement arises, however, over the feasibility of implementation, and here matters are more complex than appears. Four basic approaches are analyzed. Authors are philosophers at Stellenbosch. Haught, John F. "The Emergent Environment and the Problem of Cosmic Purpose." Environmental Ethics 8(1986):139-50. Our general vision of the world will undoubtedly affect our environmental ethics. Scientific materialism is the "general vision" that undergirds many scholarly and popular presentations of science today. It is questionable whether this materialist metaphysics can consistently sustain an environmental concern. If scientists influenced by the materialistic outlook, nonetheless, happen to be environmentalists, it is in spite of and not because of their materialist philosophies of nature. What we need, therefore, is a cosmological vision that is more consistently supportive of an environmental ethic. Religious visions are often ambiguous in their attitude toward the natural environment. Alfred North Whitehead and his followers weave modern science, philosophical sophistication and religious cosmology into a metaphysical vision fully and consistently supportive of a vigorous environmental ethic. Haught is

in the department of theology, Georgetown University, Washington, D.C. (EE)

Haught, John F., The Promise of Nature: Ecology and Cosmic Purpose. Ramsey, NJ: Paulist Press, 1993. 150 pages. \$ 9.95. (v3,#4) Seeing nature simply as a revelation of God is a problematic notion, because the indifference of nature to human pain leads to the conclusion that the God present in nature can be cruel indeed. Instead, Haught proposes thinking of the evolutionary story of nature in ways that include its imperfection and mystery, as symbolic of the divine promise of further life to come, life beyond losses, even beyond death. In an ecological Christianity, life after death might be envisioned, not as a separation from the cosmos, but as entering into the life of God in ways that include deeper participation in a compassionate relationship to the world. In this vision, our own spiritual journeys are deeply enmeshed in appreciating and enhancing the beauty and meaning of the cosmos, not only during life on Earth, but in life after death. Haught is a theologian at Georgetown University.

Haught, Paul. "Hume's Projectivist Legacy for Environmental Ethics." Environmental Ethics 28(2006):77-96. Hume's projectivist theory of value suggests that (environmental) values are either individually or culturally relative and that intrinsic value ascriptions are incoherent. Previous attempts to avert these implications have typically relied on modified Humean accounts that either universalize human sensitivity to the value of the more-than-human world or that adapt the concept of intrinsic value to suit a world in which all values are projected. While there are merits to these approaches, there is another alternative. Hume's own moral theory promises to be an even richer source for environmental ethical discourse than previously thought, and this richness is owed in large part to the robustness of Hume's theory of virtue. (EE)

Haupt, Lyanda. "Feathers and Fossils." Wild Earth 6, no.1 (1996): 44. (v7, #3)

Hausauer, Brenda Kay, Philosophical and Literary Methodology: Holmes Rolston's Literary Philosophical Methods. Master's thesis at Colorado State University, spring 1993. Section One: The differences between nature writing and environmental philosophy, comparing writer Annie Dillard and philosopher Holmes Rolston. Different strategies and the postures reader adopt toward the text. One conclusion is that all philosophical texts should be partially evaluated as artistic works. Section II. Nine of Rolston's more "non-philosophical" and partially artistic (literary) texts are examined in detail for the blending of appeal to experience and to argument. Section III. The place of autobiographical references. All of Rolston's methods examined are uses of the personal in philosophical texts, here compared with Annie Dillard's and philosopher Erazim Kohak's uses of the personal. Some of Rolston's non-philosophical, literary methods raise questions which could help to bring about a reconceptualization of philosophy's traditional methodology. (v4,#1)

Hauser, Marc, "Our Chimpanzee Mind," Nature 437(1 Sept. 2005):60-63. Hauser argues that there is continuity between our human mind and the chimpanzee mind; he simultaneously concedes "we are virtually in the dark when it comes to understanding how genes build minds." He also thinks that there is language in the human mind but not in the chimp mind.

Havel, JE; Lee, CE; Vander Zanden, JM, "Do Reservoirs Facilitate Invasions into Landscapes?" *BioScience* 55 (no. 6, June 2005): 518-525.

The extensive construction of reservoirs over the past century has radically altered the environmental landscape on a global scale. Construction of dams on most large rivers has interrupted the connectivity of water flow and greatly increased the abundance of standing freshwater habitats. Reservoirs act as stepping-stones for the dispersal of exotic species across landscapes. A variety of passively dispersing species have invaded reservoirs, spread through interconnected waterways, and been transported to nearby disconnected habitats. We hypothesize that reservoirs are more readily invaded than natural lakes, because of their physiochemical properties, greater connectivity, and higher levels of disturbance. Here we summarize properties of reservoirs that would make them prone to invasions and discuss cases in which reservoirs have facilitated rapid range expansion. Our overview illustrates linkages between two important forms of global environmental change: the widespread manipulation of river flows and the accelerating spread of exotic species.

Havlick, David, No Place Distant: Roads and Motorized Recreation on America's Public Lands. Washington, DC: Island Press, 2002. The first comprehensive treatment of roads and motorized recreation on America's public lands. America's national forests, parks, wildlife refuges, and other public lands suffer from an abundance of roads in poor condition, exacerbated by growing motorized recreational use of snowmobiles and all-terrain vehicles. A realistic case for road removal and regulations for motorized use that recognizes the complexity of the debate, and the underlying questions of values that dictate many management decisions. Hawkins, Ronnie. "Cultural Whaling, Commodification, and Culture Change." Environmental Ethics 23(2001):287-306. Whaling is back on the international stage as pro-whaling interests push to reopen commercial whaling by overturning the moratorium imposed in 1986. Proponents of ending the ban are using two strategies: (1) appealing to public sentiment that supports indigenous subsistence whaling by attempting to cloak commercial whaling in the same guise and (2) maintaining that reopening commercial whaling is the "scientific" option. I reject both ploys, and instead shift the focus for global debate to scrutinizing the industrial economic model that Western culture is currently imposing on the rest of the world, a model which ultimately reduces all life forms to mere commodities for the marketplace. Hayden, Patrick. "Gilles Deleuze and Naturalism: A Convergence with Ecological Theory and Politics." Environmental Ethics 19(1997):185-204. Some philosophers in recent discussions concerned with current ecological crises have attempted to address and sometimes to utilize poststructuralist thought. Yet few of their studies have delineated the ecological orientation of a specific poststructuralist. In this paper, I provide a discussion of the naturalistic ontology embraced by the contemporary French philosopher Gilles Deleuze, one of the most significant voices in poststructuralism. I interpret Deleuze as holding an ecologically informed perspective that emphasizes the human place within nature while encouraging awareness of and respect for the differences of interconnected life on the planet. I also suggest that this view may be joined with Deleuze's innovative ethical-political approach, which he refers to as micropolitics, to create new ways of thinking and feeling that support social and political transformation with respect to the flourishing of ecological diversity. Finally, I briefly show how Deleuze's ecological orientation compares to several versions of ecological theory and politics. Hayden lives in Seattle, WA, and has taught at DePaul University. (EE)

Hayden, Tom, The Lost Gospel of the Earth. San Francisco: Sierra Club Books, 1996. The Bible, despite interpretations to the contrary, urges us to treat the Earth as sacred. Haynes, Richard P. "Do Regulators of Animal Welfare Need to Develop a Theory of Psychological Well-being?" *Journal of Agricultural and Environmental Ethics* 10(2001):231-240. The quest for a "theory of nonhuman minds" to assess claims about the moral status of animals is misguided. Misframed questions about animal minds facilitate the appropriation of animal welfare by the animal user industry. When misframed, these questions shift the burden of proof unreasonably to animal welfare regulators. An illustrative instance of misframing can be found in the US National Research Council's 1998 publication that reports professional efforts to define the psychological well-being of non-human primates, a condition that the US 1985 animal welfare act requires users of primates to promote. The report claims that "psychological well-being" is a hypothetical construct whose validity can only be determined by a theory that defines its properties and links it to observed data. This conception is used to contest common knowledge about animal welfare by treating psychological well-being as a mental condition whose properties are difficult to discover. This framework limits regulatory efforts to treat animal subjects less oppressively and serves the interests of the user industry.

A more liberatory framework can be constructed by recognizing the contested nature of welfare norms, where competing conceptions of animal welfare have implications about norm-setting authority, as it does in other regulatory contexts, e.g., food safety. Properly conceptualized welfare should include both the avoidance of distressful circumstances and the relationship between an animal's capacities to engage in enjoyable activities and its opportunities to exercise these capacities. This conception of animal welfare avoids appropriation by scientific experts.

The development of the psychological well-being regulation is a good illustration of how social norms are contested and then appropriated, and a critique of this appropriation shows how it can be challenged. Keywords: animal welfare, primates, psychological well-being, regulation. Haynes is in the Department of Philosophy, University of Florida, Gainesville, FL. (JAEE)

Haynes, Richard W., and Quigley, Thomas M., "Broad-scale Consequences of Land Management: Columbia Basin Example," *Forest Ecology and Management* 153(2001):179-188. The Interior Columbia Basin Ecosystem Management Project in the northwestern U.S. provides a useful example where scientists, managers, and the public have explored presumed or real conflict between broad ecological and socioeconomic goals. A successful strategy for broad-scale land management will need to: maintain long-term sustainability of resources and ecosystems; maintain socioeconomic resiliency; continually assess results of management activities; manage risks and opportunities through consistent approaches at multiple scales; expand our knowledge base; and adaptively manage for new knowledge and assessments of resource conditions/capabilities. Hayward, John A., "Environmental Management--Science or Ethics?" A distinguished lecture at the University of Otago, New Zealand. Environmental management in New Zealand has been highly professionalized in a relatively brief period of time and operated within a development ethic. "The result is that whereas science has enabled us to consider and debate the environmental implications of alternative courses of action, the moral or ethical decision as to our choice of option have been prescribed for us and not open to debate. Thus, although decisions relating to the use of our environment should be based on both ethical and scientific considerations, the ethical issues have been consistently subservient to the scientific. However, the recent New Zealand legal and Parliamentary decisions indicate clearly that ethical issues are, in future, to be considered in the allocation of use of our environments." John A. Hayward is with the Centre for Resource Management, University of Canterbury and Lincoln College. Address: University of Canterbury, Private Bag, Christ Church, New Zealand. (v1,#4)

Hayward, Tim, "Anthropocentrism: A Misunderstood Problem," Environmental Values 6(1997):49-63. ABSTRACT: Anthropocentrism can intelligibly be criticised as an ontological error, but attempts to conceive of it as an ethical error are liable to conceptual and practical confusion. After noting the paradox that the clearest instances of overcoming anthropocentrism involve precisely the sort of objectivating knowledge which many ecological critics see as itself archetypically anthropocentric, the article presents the following arguments: there are some ways in which anthropocentrism is not objectionable. The defects associated with anthropocentrism in ethics are better understood as instances of speciesism and human chauvinism; it is unhelpful to call these defects anthropocentrism because there is an ineliminable element of anthropocentrism in any ethic at all; moreover, because the defects do not typically involve a concern with human interests as such, the rhetoric of anti-anthropocentrism is counterproductive in practice. Hayward, Tim, Ecological Thought: An Introduction Polity Press, Oxford, 1995, in association with Blackwells, Cambridge, 1995. \$ 45 cloth, \$ 22.95 paper. 272 pages. This is a sustained and comprehensive examination of the question whether the newly emerging ecological movement is compatible, theoretically and practically, with the Enlightenment project of Western Europe, as this has played out in the modern, now largely Westernized, world. The general answer is that, after a sort of dialectic between ecology and enlightenment, it is. This is spelled out in five chapters. Chapter 1 is philosophical; it compares ecological and Enlightenment accounts of nature and human nature. Chapter 2 asks whether humanism, the Enlightenment ideal, can be ecological, showing appropriate respect for nonhuman nature. Chapter 3 is on economics, especially on the industrial capitalism that has somehow been one of the main outcomes of Enlightenment. Chapter 4 asks whether rights and justice (the Enlightenment ethical ideas) can be retained in an ecological era. Chapter 5 is on politics, and asks whether ecological ideas can be made compatible with democracy, which is another main outcome of the Enlightenment ideal.

Hayward is good at going back into Enlightenment ideals and finding new resources in them, or old resources forgotten or obscured. But he is never naive or simplistic about this. He fully recognizes that much of what the Enlightenment stood for will have to be considerably chastened. The world is not so much a compromise as a kind of dialogue, with Enlightenment as the thesis, environmentalism as antithesis, and Hayward's new position a synthesis in which both are significantly transformed. Hayward teaches politics at the University of Edinburgh. (v7,#1)

Hayward, Tim, "Ecology and Human Emancipation," Radical Philosophy (Canterbury, Kent, UK) 62(1992):3-13. Traditional socialist conceptions of emancipation as a move from a sphere of necessity to one of freedom are radically problematic from an ecological perspective. There is no problem with removing coercive and exploitative human relations, but the ecological perspective casts doubt on the possibility or desirability of emancipation from nature-imposed necessity. There are three different meanings of emancipation from nature, not all equally objectionable. One is the aim of subsistence, transforming nature to meet human needs for food, shelter, and good health. Another is the Promethean aim of transcending natural limits, to which Marx has some tendencies. A third is the emancipation of human creativity, the humanist aim of self-realization, which does see humans as autonomous of the order of natural causality, though not necessarily as pitted against nature, and Marx can be interpreted from this perspective. Hayward is lecturer in philosophy at the University of Glamorgan, Wales. (v5,#3)

Hayward, Tim, "Universal Consideration as a Deontological Principle: A Critique of Birch," Environmental Ethics 18(1996):55-63. A major problem that skeptical critics have identified with the project of environmental ethics as it is often conceived is that it involves the search for a criterion of moral considerability, and some claim that this search has not only been unsuccessful, but it is in principle mistaken. Thomas H. Birch has recently argued that this whole problem can be avoided through his proposal of universal consideration in a 'root sense,' which applies to all beings, with no exceptions marked by any of the criteria proposed by others. I argue that the strengths of this proposal are its openness to new value discoveries and its focus on agents' practices. Its flaw is its failure to account convincingly for how values are ever formulated or obligations generated. Hence, it does not represent a viable alternative to the approach he rejects. However, rather than return to that approach, I suggest that Birch's own line of argument could be developed more consistently if, from his starting point of 'deontic experience,' one were to develop an explicitly deontological ethic that focuses more decisively on moral consideration as opposed to moral considerability. Hayward is in politics, University of Edinburgh. (EE)

Hayward, Tim, Review of: Andrew Dobson (ed.), Fairness and Futurity: Essays on Environmental Sustainability and Social Justice, Environmental Values 11(2002):511-513.

Hayward, Tim, Political Theory and Ecological Values. Cambridge: Polity Press, 1998. 196 pages. Hayward continues to press his case for ecological issues to be made more central to the enterprise of political theory. He now challenges the conventionally established opposition between a more radical ecologism (caring for nature for nature's sake) and a more reformist environmentalism (caring for nature for our sake); there is no clear distinction to be made between ecological values, on the one hand, and human interests, on the other. The more manageable inquiry is how far our existing values can be maintained in the face of ecological realities. What aspects of being human must be accommodated if a political theory is to avoid being unecological? There are essentially two such aspects: Human beings are a part of nature, and they are not generally motivated to do what is other than in their own interests. Eventually, this means that ecological values must be found consistent with the pursuit of human interests. The most fundamental interest of humans is in integrity, understood as wholeness, unity, and health in one's physical, mental, and spiritual being, and enlightened self-interest can and should include an interest that includes whole-hearted respect for the good of non-human beings. Hayward is in politics at the University of Edinburgh. (EE v.12,#1)

Hearne, Vicki, "What's Wrong with Animal Rights," Harper's, September 1991. An animal trainer claims that many domestic animals gain their fullest satisfaction from the right kind of training. Animals benefit from demanding work that challenges their potential. "The logic of the animal-rights movement places suffering at the iconographic center of a skewed value system." "The problem with the animal-rights advocates is not that they take it too far; it's that they've got it all wrong." "Work is the foundation of the happiness a trainer and an animal discover together." Of her dog, Drummer, she says, "I have enfranchised him in a relationship to me by educating him, creating the conditions by which he can achieve a certain happiness specific to a dog." "Only Drummer's owner has the power to obey him--to obey who he is and what he is capable of--deeply enough to grant him his rights and open up the possibility of happiness." (v2,#4)

Hebel, Sara, "On a Mountaintop, a Fight between Science and Religion," Chronicle of Higher Education, June 28, 2002, A21-A22. The Universities of Minnesota and Virginia are debating whether to participate and become the latest institutions in one of the world's largest and most powerful binocular telescopes, located on U.S. Forest Service land on Mt. Graham in the Pinaleno Mountains of southeastern Arizona. Two telescopes already exist on the site, but this larger telescope would be completed in 2004. The

project is underway by a consortium of universities, led by the University of Arizona. Astronomers at both institutions say using the telescope is crucial to the frontiers of research, but Apache Indians consider the telescope construction there to be on their sacred grounds. A further issue is what happens to the Mt. Graham red squirrel and to the mountaintop ecosystem. (v.13, #3)

Hecht, James L., "Good Intentions: The Mismanagement of Foreign Aid," Christian Century 113 (no. 32, November 6, 1996):1063-65. Good summary article on why U. S. foreign aid goes so wrong, failing of its humanitarian motives. Also, how misinformed most Americans are about it. When polled a large majority say that foreign aid is now too much, believing it to be about 15% of the federal budget, and that it ought to be no more than 5%, when in fact only 1% was spent. U.S. foreign aid is by far the least of any industrialized nation, in terms of percentage of GNP. Hecht teaches political science at Temple University. (v8,#1)

Hedleston, Jo Ann, The Origins of the Animal Husbandry Ethic, M.A. thesis, Colorado State University, summer 1998. A historical account of the ethical idea of kindness to animals that is part of the animal husbandry ethic as found in British and American culture. Deals in particular with the philosophy of Thomas Jefferson as the author of the American agrarian dream, with attention to the influence on the Christian tradition of the utilitarian ethic of Frances Hutcheson. The modern ideas of kindness to animals, or refraining from cruelty to animals, comes from the social humanitarian movement in Britain during the eighteenth and nineteenth centuries. The idea is transformed from the ethics that we ought not to be cruel to animals because it might lead in turn to cruel treatment of animals into a new ethics that claims that we ought to be kind to animals because they are sensitive creatures with a value of their own beyond that of human use. Includes some relatively unknown literature of the animal welfare movement in Britain. Comparisons with contemporary theological defenders of animal rights. (v9,#2)

Heeger, Robert and Frans W.A. Brom. "Intrinsic Value and Direct Duties: From Animal Ethics Towards Environmental Ethics?" Journal of Agricultural and Environmental Ethics 10(2001):241-252. Three types of concern for animal welfare are widely held: animals should feel well, they should function well, and

they should lead natural lives. The paper deals with a well-known answer to the question of why such concerns are morally appropriate. Human beings have direct duties towards animals, because animals are beings that can flourish, the flourishing of animals is intrinsically or inherently valuable, and that which is conducive to their flourishing is a legitimate object of moral concern. Looking for a tenable conception of direct duties towards animals, the following questions are discussed: what should we take it to mean that "animal flourishing is intrinsically or inherently valuable?" Under what conditions does a living being's ability to flourish create direct duties towards this being? Is awareness or sentience required for there to be direct duties towards a living being? Does such a requirement imply that moral concerns for animals would be limited to their feeling well, or does it also give way to having moral concerns for their functioning well and leading natural lives? Can one take into account considered judgements that claim that towards different animals we have moral duties that differ in kind and/or strength? If environmental ethics cannot be based on the conception of direct duties here discussed, should one draw a distinction between duties towards ourselves, our fellow human beings, or animals, and duties regarding plants, or collective entities such as populations, species, and ecosystems? Keywords: duties towards animals, Rollin, Taylor. Heegee and Brom are at the Centre for Bioethics and Health Law and Faculty of Theology, Utrecht University, Utrecht, The Netherlands. (JAEE)

Heffernan, James D. "The Land Ethic: A Critical Appraisal." Environmental Ethics 4(1982):235-47. Aldo Leopold's "Land Ethic" centers on the maxim: "A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise." I contribute to the critical appraisal of this maxim by providing answers to the following questions: (1) what is referred to by the phrase "the integrity, stability, and beauty of the biotic community"? (2) What "things" tend to preserve or threaten the integrity, stability, and beauty of the biotic community? (3) Are the integrity, stability, and beauty of the biotic community goods such that preserving them is right and failing to do so wrong? Heffernan is in the department of philosophy, University of the Pacific, Stockton, CA. (EE)

Hefler, S, "Review of: Ecosystem Change and Public Health: A Global Perspective edited by Joan L. Aron and Jonathan A. Patz," Journal of Environment and Development 11(no.4, 2002): 443-445.

Hefner, Phil, "Nature, God's Great Project," Zygon 27(1992):327-341. Scientific understandings suggest very strongly that humans are related to the rest of nature in ways that are expressed by both metaphors of genetic kinship and by ecological interrelatedness. The image of genetic kinship is the more intense image, and also the most likely to cause discomfort for Western traditions. Both secular critical reason and Western religious traditions favor images that portray the relation of humans to nature in terms of separation, domination, and stewardship. At best they are ambivalent toward portrayals of a more intense relatedness. In order best to serve our self-understandings, we must recognize (1) our intrinsic kinship with the rest of nature; (2) that our purpose as humans is to serve nature; (3) that we are preparers for nature's future; (4) that our highest calling as humans is to discern the dimensions of ultimacy in nature and to conceptualize them. In this, we follow God's own pattern of investing in nature as the greatest project. Hefner is professor of systematic theology at Lutheran School of Theology at Chicago. (v4,#4)

Hefner, Philip, "Can Nature Truly Be Our Friend?" Zygon 29(1994):507-528. Western culture has not offered a concept of nature rich enough to allow for an understanding of it as a domain of graciousness. Christian theology has consistently spoken of nature in terms that defy the limitations of the authorized views proposed by the ambient Western cultures. Science today furnishes for the first time an authorized concept of nature that is large and dynamic enough to entertain the dimension of grace. Hefner is in theology at the Lutheran School of Theology, Chicago. (v5,#4)

Heggen, Bruce Allen, A Theology for Earth: Nature and Grace in the Thought of Joseph Sittler, 1995, McGill University (Canada), Ph.D. thesis in theology. 429 pages. A theology adequate for an

environmental ethic is found in the American Lutheran theologian, Joseph Sittler. This is not a "theology of nature," but an "incarnation theology applied to nature." The roots for Sittler's environmental concerns lie in the Christology and eucharistic theology of Martin Luther. Sittler also retrieves the theology of the second century theologian, Irenaeus of Lyons, in whom creation and redemption are acts of the same God. Sittler develops a "theology for earth," emphasizing the continuity of nature and grace and, using concepts drawn from literature, music, architecture, painting, and modern physics, articulates an "ontology of communion" in which human beings recognize the presence of God in their own participation in the raw materials and processes of the world. The advisor was D. J. Hall. (v.10,#1)

Heimert, Andrew Jackson. "Keeping Pigs Out of Parlors: Using Nuisance Law to Affect the Location of Pollution," Environmental Law 27(no.2, 1997):403.

Heimert discusses environmental regulations through nuisance law and compares this type of pollution regulation to the modern antipollution statutes, which he argues do not provide locational incentives. He then argues that nuisance law retains an advantage over existing statutory regimes in that it addresses harms created by pollution and can thereby provide incentives to locate so as to mend the harms polluters create. Because of this advantage, Heimert concludes that state nuisance law is not preempted by federal statutes and should be utilized to supplement current environmental laws. (v8,#3)

Heinegg, Peter. "Ecology and Social Justice: Ethical Dilemmas and Revolutionary Hopes." Environmental Ethics 1(1979):321-27. The destructive tension between human needs and environmental conservation arises from flaws in our political and economic structures. Oppression of people and devastation of nature go hand in hand, and the root of both these evils is the denial of otherness. The ecology movement is basically a movement of liberation, and is in league, de jure and de facto, with other liberation movements, since it seeks to promote the rights of the nonhuman world. In this context, subjugation of the Other is immoral in all forms and ultimately suicidal. Recognition of the value of nonhuman nature does not preclude a rational use of it, but requires something analogous to the primitive custom of apologizing to the spirits of prey, i.e., a mixture of religious respect and common sense. Awareness of the beauty and power of nature, like awareness of the injured rights of our fellow humans, creates a revolutionary moral imperative to change the life of our society. Heinegg is in the department of English, Union College, Schenectady, NY. (EE)

Heinen, Joel T., "Thoughts and Theory on Incentive-Based Endangered Species Conservation in the United States," Wildlife Society Bulletin 23 (no. 3, 1995):338-345. There are broad national benefits to endangered species conservation but the costs of such programs are frequently localized and may fall more on some members of society than others. The judicious use of incentives can then be important. Economic incentives may be needed to promote most endangered species conservation programs because benefits of these programs are usually diffuse and national, while costs are localized. A main priority for recovery plans should be to provide people with social and economic incentives, at socially relevant

scales, to accept the proposed conservation program. Heinen is in environmental studies, Florida International University, Miami. (v.10,#1)

Heinrich, Bernd, Racing the Antelope: What Animals Can Teach Us About Running and Life. New York: Harper Collins, Cliff Street Books, 2001. Held, Martin, "Geschichte der Nachhaltigkeit" (in German: History of sustainable development), Natur und Kultur 1 (No. 1, 2000): 17-31. Understanding of the history of sustainable development is a prerequisite to develop this concept adequately and acting accordingly. This general thesis is demonstrated with various examples from different times and regions in the history of humankind. Some preliminary theses are derived to generalize findings of these examples and perspectives are demonstrated which may be learned from an explicit study of the history of sustainable development. (v.11,#2)

Heldke, Lisa, "Unnatural Selection," Ethics and the Environment 3(1998):41-54. The notion that "nature" comes equipped with its own set of categories, enabling us to divide up everything that exists without overlap or leftovers, has considerable explanatory and prescriptive power, I examine two apparently unrelated arenas in which this notion is at work; namely, in the alleged discovery and subsequent physical "improvement" of the headwaters of the Mississippi River, and in the surgical alteration of intersex infants. In both cases, reconstruction is undertaken as a means of eliminating an ambiguity regarded as "unnatural"--an "error" in nature that culture must correct. Eliminating ambiguity, in turn, enables accessibility. Fixing a person or a river firmly in a category allows us to have various kinds of access to them. For a river, the access is in part physical; it means being able to walk up to its headwaters without wearing hip waders. For a person, that access is both intellectual and social; only once I know what sex a person is, do I know how to treat them, and only then do I know whether they are an "appropriate" object of my erotic attention. Heldeke is in philosophy, Gustavus Adolphus College, St. Peter, MN. (E&E)

Hellberg, Tom. "Incineration by the Back Door: Cement Kilns as Waste Sinks." The Ecologist (1979) 25(no.6, Nov.1995):232. Since 1992, a number of UK cement manufacturers have been burning high toxic waste as a "fuel" for their cement kilns. Subject to less stringent emission standards than specialized incinerators, kilns offer a cheap but dirty disposal option which waste generators are exploiting to the full. Pollution and ill-health are the results. (v7,#1)

Helm, Carsten, and Simonis, Udo E. "Distributive Justice in International Environmental Policy: Axiomatic Foundation and Exemplary Formulation," Environmental Values 10(2001):5-18. Abstract: Proceeding on a limited number of general, widely accepted equity criteria, we develop a proposal for distributing common resources. In particular, the proposed fair division mechanism is individually

rational, envy-free, Pareto-efficient and satisfies the stand alone test, which follows as a minimum requirement from the resource and population monotonicity criteria. Applied to international climate policy, the thrust of this proposal is that the South should initially be fully compensated for the greenhouse gas abatement measures it is to undertake as a result of efficiency considerations. Keywords: Fair division, equity, common resources, climate change. Helm is at Otto-von-Guericke-University Magdeburg, Faculty of Economics and Management. Simonis is at the Science Centre Berlin, Environmental Policy Studies. (EV)

Henberg, Marvin. "Wilderness as Playground." Environmental Ethics 6(1984):251-63. Play requires security from sober concerns, and only recently have non-native North Americans felt secure enough in wilderness lands to view them as potential playgrounds. Employing a pretend quality of play illusion, many kinds of play are derivatives from normally sober activities. I argue that the most genuine sorts of wilderness play derive from the activities of the original geographical explorers. It is thus possible to distinguish types of play for which wilderness is especially suited from types that merely happen in the wilderness--i.e., for which wilderness is an accidental playground. Play values are important enough to receive serious consideration in the administration of wilderness lands, and I conclude that our public policy ought to favor wilderness activities that most closely imitate the activities of the original geographical explorers. Henberg is at the Philosophy Dept., University of Idaho, Moscow, ID. (EE)

Hendrickson, Mary K., Harvey S. James and William D. Heffernan, "Does The World Need U.S. Farmers Even If Americans Don't?" Journal of Agricultural and Environmental Ethics 21(2008):311-328. We consider the implications of trends in the number of U.S. farmers and food imports on the question of what role U.S. farmers have in an increasingly global agrifood system. Our discussion stems from the argument some scholars have made that American consumers can import their food more cheaply from other countries than it can produce it. We consider the distinction between U.S. farmers and agriculture and the effect of the U.S. food footprint on developing nations to argue there might be an important role for U.S. farmers, even if it appears Americans don't need them. For instance, we may need to protect U.S. farmland and, by implication, U.S. farmers, for future food security needs both domestic and international. We also explore the role of U.S. farmers by considering the question of whether food is a privilege or a right. Although Americans seem to accept that food is a privilege, many scholars and commentators argue that, at least on a global scale, food is a right, particularly for the world's poor and hungry. If this is the case, then U.S. farmers might have a role in meeting the associated obligation to ensure that the poor of the world have enough food to eat. We look at the consequences of determining that food is a right versus a privilege and the implications of that decision for agricultural subsidies as well as U.S. agriculture and nutrition policies. The authors are in the Department of Rural Sociology Division of Applied Social sciences, University of Missouri, Columbia.

But, unfortunately, many do not stop with their target organisms. In Hawaii, wasps introduced to fight pests on sugar cane have now upset swamp ecosystems, quite different environments from the sugar fields. (v.12,#4)

Henning, Brian G., *The Ethics of Creativity: Beauty, Morality, and Nature in a Processive Cosmos*. Pittsburgh: University of Pittsburgh Press, 2005. A central concern in environmental ethics is its desire to extend the scope of direct moral concern beyond human beings to plants, nonhuman animals, and the systems of which they are a part. Although nearly all environmental philosophies have long since rejected individuals as isolated and independent substances, few have replaced this worldview with an alternative that is adequate to the organic, processive world. Alfred North Whitehead has the potential to make a significant contribution to environmental ethics, as do William James, John Dewey, and Charles Sanders Pierce. Also using Aldo Leopold, Peter Singer, Albert Schweitzer, and Arne Naess, Henning develops an ethical theory of creativity. This emphasizes the well-being of wholes, while not losing sight of the importance of the unique centers of value that constitute these wholes. Enhancing intrinsic beauty everywhere is shown to be our deepest obligation and our highest joy.

Henrich, Karoly, "Gaia Infiltrata: The Anthroposphere as a Complex Autoparasitic System." Environmental Values 11(2002):489-507. This paper compares the heuristic potential of three metaphorical paired concepts used in the relevant literature to characterize global relationships between the anthroposphere and the ecosphere. Methodologically, the guiding question is whether and to what extent metaphorical theses can support an arrival at hypotheses which accurately reflect reality and possess explanatory force. The predator-prey model implies that the populations of two species in such a relationship in principle exhibit coupled oscillations, giving prey populations the possibility of periodic regeneration. For some time, however, the most important indicators of human destruction of nature have been showing a relentless upward trend which appears to render the tumour-host metaphor more appropriate. Another fact which favors this analogy is that a tumour develops within its host and from its host's normal cells, in a similar way to the emergence of the anthroposphere from within the biosphere. But the parasite-host analogy also allows the formulation of fruitful hypotheses, since ecological parasitology is equally familiar with varieties of autoaggressive interaction and provides a means of focusing particularly on the adelphoparasitic hierarchy within the anthroposphere. Henrickson, Mary K., and Harvey S. James, "The Ethics of Constrained Choice: How the Industrialization of Agriculture Impacts Farming and Farmer Behavior," Journal of Agricultural and Environmental Ethics 18(2005):269-291. Constraints created by the economic environment of farming

limit what options a farmer has available. The fact that decisions are constrained creates new ethical challenges. Having fewer options when faced with severe economic pressures is a very different situation than having many options available. This increases the likelihood that farmers will consider unethical behavior. The authors are at the University of Missouri-Columbia. (JAEE)

Henry, Todd, "Yellowstone's Trophic Cascade: Evidence of an Ecosystem on the Mend?" Yellowstone Discovery 21 (no. 2, Summer 2006): 1-5. Since the wolf reintroduction to Yellowstone ten years ago, there is compelling evidence of quantifiable increase in biomass and biodiversity in the Greater Yellowstone Ecosystem as a whole, especially evident where wolves are most common, in the Lamar Valley and the Northern Range. The increase is in species ranging from willows to beavers to foxes and rodents. The only species to decrease in numbers is coyotes.

Hepburn, Ronald W., "Landscape and the Metaphysical Imagination," Environmental Values 5(1996):191-204. Aesthetic appreciation of landscape is by no means limited to the sensuous enjoyment of sights and sounds. It very often has a reflective, cognitive element as well. This sometimes incorporates scientific knowledge, e.g. geological or ecological, but it can also manifest what this article will call 'metaphysical imagination', which sees or seems to see in a landscape some indication, some disclosure of how the world ultimately is. The article explores and critically appraises this concept of metaphysical imagination, and some of the roles it can play in our aesthetic encounters. KEYWORDS: Landscape, aesthetics, imagination, metaphysics, sublime (EV)

Hepburn, Ronald, "Values and Cosmic Imagination." Pages 35-51 in O'Hear, Anthony, ed., Philosophy, the Good, the True and the Beautiful. The Royal Institute of Philosophy Lectures, 1998-1999. Cambridge: Cambridge University Press, 2000. The role of human imagination in appreciating cosmic nature, nature-at-large. Example: Wordsworth, on a climb of Mt. Snowdon, believes that when a poet transforms the visible universe by the power of his imagination, he imitates the creative action of nature herself. Example: Don Cupitt, Solar Ethics, takes an ethic from the sun: Live by burning out. Be headlong, outpouring as the sun is. Neither seems satisfactory; imagination can overdo it. More disciplined imagination is required. Perhaps not even serious self-understanding and self-evaluation are feasible without attempts at wider connecting, whatever the risk of illusion.

But now nature seems ambiguous. Values are present there. Although we do not receive moral guidance from nature, nature may command our respect. Nature, at least sentient animals in nature, cannot be reduced to elements in our own life-world sensibility. Respect refuses to treat nature as unlimitedly exploitable, unchecked by any principle superior to human self interest. But such respect is checked by the inextricable tangle of the creative and the destructive in nature; sometimes respect is ill-matched to nature's operations.

By cosmic imagination, we are privileged to be able to add to nature as it would be without us, by causing it to burgeon forth in the light of our consciousness. Still it is on nature's provisions that we exercise our own perceptual-creative-imaginative efforts. Nature and ourselves are indissolubly co-authors. Hepburn is emeritus professor of philosophy, University of Edinburgh. (v.11,#3)

His earlier "Aesthetic Appreciation of Nature," (Harold Osborne, ed., Aesthetics in the Modern World, New York: Weybright and Talley, 1968) is a classic. The current volume, unfortunately, is available only in hardcover at \$ 59.95. (v4,#3)

Hepburn, Ronald, "Landscape and Metaphysical Imagination," a paper presented at the First International Conference on Environmental Aesthetics, in Koli, Finland, June 1994. Aesthetic appreciation of nature is many-leveled. Landscape appreciation has both perceptual and conceptual components; it can suffer from too much or too little metaphysical imagination. Metaphysics that is internal to the aesthetic experience is more likely to be enriching than metaphysics external to the experience. An example is the experience of the sublime. Hepburn is in philosophy at the University of Edinburgh. Copies: Ronald Hepburn, Department of Philosophy, University of Edinburgh, Davie Hume Tower, George Square, Edinburgh EH8 9JX. (v5,#3)

Hepburn, Ronald, "Nature Humanised: Nature Respected," Environmental Values 7(1998): 267-279. How far is it true that the aesthetic appreciation of nature obscures, rather than illuminates, its objects? Do we not humanise nature, read our own subjectivity into it, sentimentally distort it, in our aesthetic - as distinct from scientific - approaches? I argue that not all humanising falsifies, and that we can respect nature as well as annex its forms and expressive qualities in our aesthetic appreciation. Respecting/humanising are explored as two of the chief key concepts for an understanding of the complexity of aesthetic attitudes to nature. KEYWORDS: aesthetics, nature, anthropomorphic, truth, respect. Ronald Hepburn resides in Edinburgh, UK. (EV)

Hess Jr., Karl. "John Wesley Powell and the Unmaking of the West," Environmental History 2(1997):7.

Hess, Karl, Rocky Times in Rocky Mountain National Park. Niwot, CO: University Press of Colorado, 1993. 167 pages. \$ 22.50 cloth. The park is moving toward an ecological Armageddon after "three-quarters of a century of mismanagement." The biggest problem is too many elk, of which park visitors are fond, that eat willows and aspen and depress beaver populations, which disrupts the whole riparian system. Also fire suppression is a problem. There are too many elk and too few fires. Park ecologists know this, but park administrators fail to listen. Hess wants to take the park out of politics and all the political and career moves that go with it. He wants to put it in the hands of a conservation trust, whose board of directors would include faculty at the state's universities and park employees elected by their peers. Provocative, sometimes reminiscent of Alston Chase, although Hess is amply critical of Chase, and not mean-spirited. Hess is a writer with a Ph.D. in range ecology. (v5,#1)

Hess, Karl, Jr., Visions Upon the Land: Man and Nature on the Western Range. Washington, DC: Island Press, 1992. 279 pages. \$ 22.00. Written from the "wise use" perspective, Hess argues that the decline of public lands is due to fundamental failures in government policy, to ecological destabilization caused by government intrusion, and to the destructiveness of sweeping ideologies. More laws and regulations to control the conservation of natural resources are popular but ultimately futile. An application of the concept of laissez-faire politics to the management of western rangelands. Hess is an environmental writer with the Foundation for Research on Economics and the Environment, Seattle. (v3,#3)

Hess, Karl, Jr., Rocky Times in Rocky Mountain National Park: An Unnatural History. Niwot, CO: University Press of Colorado, 1993. 240 pages. \$ 22.50. Hess argues for drastic changes in how the sixth most visited park in the United States should be managed. Hess thinks the Park Service has faltered in its mission of preservation, due in part to "predatory politics" in the Park Service. Hess is described (by his friend Tom Wolf) as "a kinder, gentler Alston Chase." He is an ecologist and environmental consultant based in Las Cruces, New Mexico. (v4,#2)

Hessel, Dieter T., ed., Theology for Earth Community: A Field Guide Maryknoll, NY: Orbis Books, 1996. ISBN 1-57075-052-1 298 pp. \$20. Twenty original essays examining state-of-the-art scholarship and pedagogy in ecologically-alert theology. What needs to be done, these authors ask, to bring biblical studies, systematics, social ethics, practical theology, spiritual formation, and liturgy up to speed with eco-justice thought and action? A key study for those in religious and environmental studies who wish to comprehend the range and depth of Christian theological writing, plus some aspects of interreligious reflection, on this increasingly important subject.

An analysis of four major figures--Thomas Berry, Larry Rasmussen, Rosemary Ruether, and James Nash--on what needs to happen in theological studies to meet the environmental challenge. Other contributions: Mary Evelyn Tucker on the role of religions in forming an environmental ethic; Theodore Hiebert on rethinking traditional scriptural approaches to nature; Diane Jacobson on biblical bases for caring about ecology and justice; George Tinker on an American Indian perspective; Catherine Keller on nature, feminism, and community; Manning Marable on the power of connections in environmental justice; Thomas L. Hoyt, Jr. on environmental justice and black theology; Kosuke Koyama on cosmology and justice in ecumenical perspective; and Dieter Hessel on where the churches were/are in the U.S. environmental movement. A chapter on "The Praxis of Institutional Greening" by Richard Clugston incorporates the thought of John B. Cobb, Jr. on a theology of institutional life that will support just and sustainable community. This book can be obtained at half price (\$10) from the Center for Respect of Life & Environment, 2700 L St., NW, Washington, DC 20037 (202-778-6133)

Hessley, Rita K. "Should Government Regulate Procreation? A Third View." Environmental Ethics 3(1981):49-53. Donald Lee has claimed that of three ethical values, freedom, justice, and security-survival, involved in the effects of population growth on the future and the survival of all human beings, security-survival is the most fundamental. As such, it should have priority over freedom and justice. Based on this hierarchy, Lee draws the conclusion that one does not have the right to unlimited procreation, and that ultimately it is the duty of government to impose limits on population growth. I accept Lee's argument that personal rights must be balanced by personal responsibility, but I argue that justice is the fundamental ethical principle in this discussion. This is not a trivial distinction, for it leads to two significant conclusions. First, by focusing proper attention on justice, the threat to survival of the race from overpopulation is reduced to reasonable and realistic proportions. Second, and particularly important with regard to Lee's position, the recognition of the need for justice brings to light the fact that the primary responsibility of government is to address itself to redressing injustice in society, injustice which does pose a very real threat to the survival of mankind. In this context, I argue that under no circumstances should government have the right or the responsibility to enforce limits on procreation. Hessley is at the Oak Ridge National Laboratory, Oak Ridge, TN. (EE)

Hester, Lee, Dennis McPherson, Annie Booth, and Jim Cheney. "Indigenous Worlds and Callicott's Land Ethic." Environmental Ethics 22(2000):273-290. We assess J. Baird Callicott's attempt in Earth's Insights to reconcile his land ethic with the "environmental ethics" of indigenous peoples. We critique the rejection of ethical pluralism that informs this attempted rapprochement. We also assess Callicott's strategy of grounding his land ethic in a postmodern scientific world view by contrasting it with the roles of "respect" and narrative in indigenous "ethics." (EE)

Hettinger, Ned, and Bill Throop. "Refocusing Ecocentrism: De-emphasizing Stability and Defending Wildness." Environmental Ethics 21(1999):3-21. Traditional ecocentric ethics relies on an ecology that emphasizes the stability and integrity of ecosystems. Numerous ecologists now focus on natural systems that are less clearly characterized by these properties. We use the elimination and restoration of wolves in Yellowstone to illustrate troubles for traditional ecocentric ethics caused by ecological models emphasizing instability in natural systems. We identify several other problems for a stability-integrity based ecocentrism as well. We show how an ecocentric ethic can avoid these difficulties by emphasizing the value of the wildness of natural systems and we defend wildness value from a rising tide of criticisms. (EE)

Hettinger, Ned, "Enhancing Natural Value?" Human Ecology Review 3(no. 1, 1996):8-11. There is a widespread skepticism among those with deep environmental commitments to the natural world about the idea that humans can improve upon nature. While it seem obvious that humans that humans can alter nature to better serve human uses, it is far from clear that humans can improve nature in non-utilitarian

ways. An analysis of whether and how human participation in nature might be seen as enhancing, rather than degrading, intrinsically-valuable natural systems. Wildness will be lost with human intervention, though, in some circumstances, biodiversity might be gained. One would have to weigh tradeoffs. Hettinger is in philosophy, College of Charleston, SC. (v.13,#1)

Hettinger, Ned, "Enhancing Natural Value?" Human Ecology Review 3 (no. 1, Autumn, 1996):8-11. There is widespread skepticism about the idea that humans can improve upon nature. While it seems obvious that humans can alter nature better to serve human purposes, it is far from clear that human can improve nature in non-utilitarian ways. Can humans enhance intrinsic natural value? The strongest reason for skepticism about this possibility is the value that many see in the "wildness" of nature. Alleged human improvements degrade nature in terms of its wilderness value. Such valuing of pristine nature has been severely criticized for instituting a false human/nature apartheid that provides no positive role for humans in the natural world. Can human participation in nature be seen as enhancing rather than degrading intrinsically valuable natural systems. Hettinger is in philosophy, College of Charleston, SC. (v.9,#3)

Hettinger, Ned, "Defining and Evaluating Exotic Species," Western North American Naturalist 61(no. 3, 2001):257-260. Exotics are species that are foreign to an ecological assemblage in the sense that they have not significantly adapted to resident biota or to local abiotic conditions, and resident species have not significantly adapted to them. Although they need not be human introduced nor damaging, when they are, a negative appraisal of such exotic species can be justified. Human introduction of exotics into natural systems typically increases human influence over those systems, thus diminishing their wildness. Valuing nature for its wildness is a rationale for the national parks' policy of letting nature take its course. Thus, Yellowstone Park has a strong reason for removing human-introduced exotics and for welcoming naturally migrating exotics. Disvaluing exotics that are neither human introduced nor damaging simply because they are foreign smacks of xenophobia. But given that wanton human mixing of species threatens to homogenize the earth's biological communities, biological nativism is justified as a way to preserve the diversity between such communities. Hettinger is in philosophy at the College of Charleston, Charleston, SC. (v.12,#3)

Hettinger, Ned. "Valuing Predation in Rolston's Environmental Ethics: Bambi Lovers versus Tree Huggers." Environmental Ethics 16(1994):3-20. Without modification, Rolston's environmental ethics is biased in favor of plants, since he gives them stronger protection than animals. Rolston can avoid this bias by extending his principle protecting plants (the principle of the nonloss of goods) to human interactions with animals. Were he to do so, however, he would risk undermining his acceptance of meat eating and certain types of hunting. I argue, nevertheless, that meat eating and hunting, properly conceived, are compatible with this extended ethics. As the quintessential natural process, carnivorous predation is rightfully valued and respected by such environmentalists as Rolston. Because the condemnation of human participation in predation by animal activists suggests a hatred of nature, the challenge for Rolston's animal activist critics is to show that one can properly appreciate natural predation while consistently and plausibly objecting to human participation in it. Hettinger, is in the department of philosophy, College of Charleston, Charleston, SC. (EE)

Hettinger, Ned. Review of Eric Katz, Nature as Subject: Human Obligation and Natural Community. Environmental Ethics 20(1998):109-12.

Hettinger, Ned. "Enhancing Natural Value?" Human Ecology Review 3, 1 (Autumn 1996): 8-11. There is widespread skepticism among those with deep commitments to the natural world about the idea that humans can improve upon nature. While it seems obvious that humans can alter nature to better serve human uses, it is far from clear that humans can improve nature in non-utilitarian ways. Can human beings enhance intrinsic natural value? Perhaps the strongest reason for skepticism about this possibility is the value that many see in the "wildness" of nature, understood as the extent to which a natural system has not been humanized. Alleged human improvements of nature humanize nature and thus degrade it in terms of wildness value. This idea of valuing and preserving relatively pristine nature for its wildness value has been severely criticized for instituting a false and harmful human/nature apartheid that provides no positive role for humans in the natural world. Critics suggest that we must move beyond preservationism and learn to integrate humans into nature, celebrating humanity's creative potential with respect to nature. This paper explores if and how human participation and involvement in nature might be seen as enhancing, rather than degrading, intrinsically-valuable natural systems. Hettinger teaches philosophy at the College of Charleston. (v8,#1)

Hettinger, Ned. Review of The Natural and the Artefactual: The Implications of Deep Science and Deep Technology for Environmental Philosophy. By Keekok Lee. Environmental Ethics 23(2001):437-441. (EE)

Hettinger, Ned. "Patenting Life: Biotechnology, Intellectual Property, and Environmental Ethics." Boston College Environmental Affairs Law Review 22 (1995): 267-305. Argues that our social policy of issuing patents in organisms and genes is not easily justified by traditional arguments for intellectual property under the utility patent system, and that these types of patents should be abolished because they manifest disrespect for life. Biotechnology does offer promise and hope for bettering human life and perhaps other life as well. Opposing biopatents does not entail opposing biotechnology. Organism and gene patents should be resisted not because biotechnology should be resisted, but rather because these biopatents are a morally dangerous and inappropriate way of thinking about and encouraging biotechnology. Without these two types of patents, biotechnical innovation would probably proceed substantially unhindered. Hettinger is at the College of Charleston, South Carolina. (v6,#1)

Hettinger, Ned. "Exotic Species, Naturalisation, and Biological Nativism," Environmental Values 10(2001):193--224. Contrary to frequent characterisations, exotic species should not be identified as damaging species, species introduced by humans, or species originating from some other geographical location. Exotics are best characterised ecologically as species that are foreign to an ecological assemblage in the sense that they have not significantly adapted with the biota constituting that assemblage or to the local abiotic conditions. Exotic species become natives when they have ecologically naturalised and when human influence over their presence in an assemblage (if any) has washed away. Although the damaging nature and anthropogenic origin of many exotic species provide good reasons for a negative evaluation of such exotics, even naturally-dispersing, nondamaging exotics warrant opposition. Biological nativists' antagonism toward exotics need not be xenophobic and can be justified as a way of preserving the diversity of ecological assemblages from the homogenising forces of globalisation. Implications for Yellowstone National Park policy are explored. Keywords: Exotics, native, nativism, naturalisation, Yellowstone National Park. Ned Hettinger is in the Philosophy Department, College of Charleston, South Carolina. (EV)

Hettinger, Ned. "Allen Carlson's Environmental Aesthetics and the Protection of the Environment." Environmental Ethics 27 (2005):57-76. Evaluation of the contribution that Allen Carlson's environmental

aesthetics can make to environmental protection shows that Carlson's positive aesthetics, his focus on the functionality of human environments for their proper aesthetic appreciation, and his integration of ethical concern with aesthetic appreciation all provide fruitful, though not unproblematic, avenues for an aesthetic defense of the environment. Hey, Jody, Genes, Categories, and Species: The Evolutionary and Cognitive Causes of the Species Problem. New York: Oxford University Press, 2001. The heart of the species problem is our human incorrigible drive to categorize any phenomenon that recurs repeatedly. We apply the mental tool of categorization to repeated instances of organisms that are similar, and call these species. Our conception of species is a basic by-product of the way we think. We devise and erect categories, but we mistake these for representations. The named species often do not, and probably will never, accurately match "real evolutionary groups," because, alas, the real evolutionary groups defy the kind of categorization our penchant demands. They have, for instance, fuzzy boundaries and not the neat boundaries our penchant favors. We need a bin structure, pigeon holes, but nature generates organisms with overlap and intergrading, revealed now at the molecular level. But it is not too clear what or whether any replacement of the species concept will enable us to respect or conserve biodiversity (which, we have also recently been told, is a social construct; see David Takacs, The Idea of Biodiversity). Hey is a geneticist at Rutgers University. (v.13,#1)

Hey, Jody, Genes, Categories, and Species: The Evolutionary and Cognitive Causes of the Species Problem. Oxford: Oxford University Press, 2001. "If there is a species of tree in the forest, and no systematist is around to diagnose it, is it still a species" (p. 153). Only halfway, argues Hey, because we humans make up species as much or more than we discover them; and, worse, our language is not at all adept for mapping species. The species problem is a consequence of linguistic confusion. "A large part of a species taxon is the human recognition apparatus" (p. 186). "What we have missed is an appreciation of our own role in devising categories, and of our own desires to have those categories be the entities in our theories. Evolutionary groups are just one major cause of our species taxa, and we are the other." (p. 157). So now we have the human (semi-) construction of species, trailing on the social construction of nature. With implications for the conservation of biodiversity that trouble Hey. Hey is in genetics at Rutgers University. (v.13,#2)

Heyd, Thomas, "Themes in Latin American Environmental Ethics: Community, Resistance and Autonomy." Environmental Values 13(2004):223-242. This paper seeks to answer the question how environmental ethics is approached in Latin America. I begin by discussing a suitable method for interpreting the question of whether there is a culturally based ethics, given that one may focus either on theory or on actually existing moral practices. Next, I consider some of the possible sources of Latin America's distinctiveness, namely its professional, cultural, and economic-historical particularities, followed by a discussion of the practice and theory of environmental ethics extant in the area. I claim that there is a concrete environmental ethics in Latin America, which can be described by the notions of community, resistance and autonomy, and suggest that this concrete ethic may be assessed both from a culture-internal and from a culture-external point of view. I close by proposing that Latin American environmental ethics may provide illuminating models for appropriate ways of acting in hybrid communities made up of human beings and nature. Keywords: ethics, environment, Latin America. Heyd is in philosophy, University of Victoria, British Columbia. (EV)

Heyd, Thomas, "Thinking through Botanic Gardens," Environmental Values 15(2006): 197-212.

This essay discusses ways of thinking about botanic gardens that pay close attention to their particularity as designed spaces, dependent on technique, that nonetheless purport to present (and preserve) natural entities (plants). I introduce an account of what gardens are, how botanic gardens differ from other gardens, and how this particular form of garden arose in history. After this I contrast three ways of understanding the function of botanic gardens in the present time: as sites of recreation, of conservation or of encounter with nature. Finally I develop the idea that these gardens may serve as archetypes of collaboration with nature. I conclude that, in principle, botanic gardens can model alternative, creative new ways for human beings to relate to the natural environment. (EV)

Heyd, Thomas. "Nature, Culture, and Natural Heritage: Toward a Culture of Nature." Environmental Ethics 27 (2005):339-354. Nature and culture are usually treated as opposites. Nature, on this conception, is on the wane as a result of culture. A fresh analysis of the relation between these two terms in the light of the notion of "cultural landscapes" is needed. This account allows for nature to be understood as an important, distinctive category, even while granting the constitutive role of the culturally structured gaze. Culture and nature need not be conceived in opposition to each other, for it makes sense to speak of, and pursue, a culture of nature. These considerations have important consequences for natural heritage conservation. (EE)

Heyd, Thomas. "The Case for Environmental Morality." Environmental Ethics 25(2003):5-24. Present environmental degradation has led some to argue that only an appeal to selfishness will "save the environment," allegedly because appeals to "morality" necessarily are ineffective, while others have suggested that we need a "new, environmental ethic." If we are interested in countering the degradation of the natural environment, we need to reconsider actual morality, how it is developed, and how it may take into account human activities affecting the natural world. Ultimately, we need to develop ways of knowing that recognize the autonomy of nature. (EE)

Heyd, Thomas. *Encountering Nature: Toward an Environmental Culture*. Williston, VT: Ashgate Publishing, 2007. Heyd claims that an attentive encounter with nature is of key importance for the development of an environmentally appropriate culture. He argues that environmental degradation should be conceived as the consequence of a cultural mismatchour cultures don't seem to be appropriate to the natural environment in which we move and on which we depend in thoroughgoing ways. To address this, Heyd weaves together a tapestry of perspectives on human interactions with the natural world that includes chapters on topics such as environmental ethics in the workplace, environment and culture in Latin America, Basho and wandering aesthetics, rock art, mining reclamation, northern plains boulder

structures, and Japanese gardens.

Heyd, Thomas. "Rapid Landscape Change, Vulnerability, and Social Responsibility." *The Northern Review*, Number 28 (Winter 2008): 95-110. From the article: "I explore the relation between vulnerability to rapid landscape change, on the one hand, and conceptions of land and responsibility for landscape, on the other. I begin by briefly discussing the notion of vulnerability to natural phenomena, and possible ways of addressing it. Next, I introduce some of the ways in which natural phenomena and processes have been perceived, and take note of the sense of responsibility toward landscape often expressed among peoples who are deeply rooted in the land. I continue with a discussion of the basis of the respect that underlies this sense of responsibility and with an account of what respect amounts to in this context. After this I point out how respect for natural phenomena may lead to a lowering of vulnerability. I conclude that it is imperative to develop those ways of conceiving of natural phenomena that will lead to a deep sense of respect and responsibility for the natural world that surrounds us." Heyd teaches philosophy at the University of Victoria. This paper is published in a special collection of proceedings from the conference "Rapid Landscape Change and Human Response in the Arctic and Subarctic," Whitehorse, Yukon (2005).

Hickman, Larry A., Pragmatic Paths to Environmental Sustainability," *Journal of Agricultural and Environmental Ethics* 20(2007):365-373. After summarizing what I take to be the main contribution of Norton's book - proposal for a new vocabulary for public discourse as it pertains to environmental stability - I attempt to locate his work among some of the current debates regarding sustainability and public policy. I detail some of the ways in which this work constitutes a further development of themes he presented in 1991 in *Toward unity Among Environmentalists*. I discuss his prescriptions for defusing confrontations regarding environmental policy by functionalizing issues in ways that cut across historically entrenched interest groups. From the standpoint of method, I argue that Norton has stacked a Habermas-type proceduralism on top of a pragmatic experimentalist platform (and I add that if he had constructed his method the other way around it would not have worked.) In all this I find Norton's proposals both imaginative and full of promise. Hickman is at the Center for Dewey Studies, Southern Illinois University Carbondale.

Hickory, Shagbark, "Everyday environmental ethics as comedy & story: A collage," Ethics and the Environment 8(no. 2, 2003):80-105. In Section I, I provide a brief historical sketch of tragedy and its relationship to Socratic philosophy-and comedy. II focuses on one aspect of tragedy, namely, its view that morality transcends natural limitations. This understanding of morality is with us still. III presents the central concerns of the world religions as evidence of a widespread feeling of alienation from the sacred and the wild, and contrasts world religions with indigenous spirituality. IV moves us away from the understanding of philosophy as argument and counterargument and toward an ecosystemic, or wild, conception of philosophy as story in the mode of comedy. V offers a Buddhist understanding of tragic alienation that sees it as expressive of something deeply problematic about humans. This something is actualized throughout Western culture but seems to exist only as a potentiality in indigenous cultures. This is reason enough to take indigenous cultures and comedy seriously. VI brings us back to earth with a sketch of comedy in the lives of dear friends. VII sketches some of the attributes of functional communities that give support to comedy. I also point out a number of features of indigenous so-called worldviews that would greatly enhance the ability of comedy to displace tragedy in the West. VIII portrays picaresque comedy as exemplifying the lessons of comedy taught by wilderness. Examples from indigenous cultures of Africa and Gary Snyder's The Practice of the Wild underscore the importance of picaresque strategies and understandings of comedy. A look at Tom Birch's enigmatic statement, "wilderness treats us like human beings," setting it alongside some lines from Thoreau's Walden, rounds out my discussion of comedy. IX poses a challenge: Can we survive "The News" that pours in upon us from tragic seats of power? The author is native American and teaches at the University of Wisconsin-Waukesha. (E&E)

Hicks, Lorin L., Henning C. Stabins, and Herter, Dale R. "Designing Spotted Owl Habitat in a Managed Forest." Journal of Forestry 97(no.7, July 1999):20- . aid.

Hiebert, Theodore, The Yahwist's Landscape: Nature and Religion in Early Israel. New York: Oxford University Press, 1996. Early Hebrew faith and nature, and what it can teach us today. (v. 15, # 3)

Hiebert, Theodore, The Yahwist's Landscape: Nature and Religion in Early Israel. New York: Oxford University Press, 1996. Adam is made from "the earth," which means "arable soil." The story of Israel is a story of farmers. "The claim that the Israelite religion valued history while it devalued nature can no longer be derived from a formative desert experience." The religion of Israel, at least the Yahwist tradition, included larger dimensions, but it was also a religion of nature.

Hiebert, Theodore, The Yahwist's Landscape: Nature and Religion in Early Israel. Oxford: Oxford University Press, 1996. 210 pages. \$ 45. The Yahwist is the so-called J strand of the Pentateuch in the Hebrew Bible, favoring the divine name Yahweh. A study of nature in early Hebrew religion. Hiebert claims that previous scholars have illegitimately rent asunder what the Bible presents as a seamless whole: nature and history as a single reality. The Hebrew patriarchs were farmers rather than wandering nomads as usually portrayed, and the arable land of the Palestinian hills country stands at the center of J's theology, a religion of the earth. The garden of Eden is not so much a mythic paradise as a cultivated valley oasis. Agriculture is the archetypal human vocation, not some romanticized pastoral nomadism. Humans are to care for and cultivate the garden Earth. (v8,#2)

Hiebert, Theodore "Re-Imaging Nature: Shifts in Biblical Interpretation" Interpretation: A Journal of Bible and Theology, 50 (no. 1, January 1996): 36-46. Nature, and the place of humans within it, has again become a topic of much discussion. The tendency of biblical scholars has been to describe the human being in terms that set it apart from nature. More recently, ecological concerns have impelled biblical scholars to rethink their position. This has caused them reevaluate the nature of humanity and to construe the human being not as standing above or at the center of nature, but as being part of nature. (v6,#4)

Hiedanpaa (Hiedanpää), Juha, "An Institutional Approach to Environmental Valuation: The Regional Forest Programme of Southwest Finland as an Example," Environmental Values 13(2004):243-260. This paper discusses the impacts of different formal and informal institutions upon the Regional Forest Programme of Southwest Finland (1997-2001). The divide between formal and informal institutions is a binary distinction: it is used as a discursive tool for identifying social structures and processes and for articulating their significance in development and environmental planning, valuation and decision-making. In the end part of the paper, there is a brief discussion of how normative and moral issues can be explicitly and more creatively integrated into the practice of environmental policy. The author is at the University of Turku, Finland. (EV)

Higgins, Paul A.T.; Harte, John, "Biophysical and Biogeochemical Responses to Climate Change Depend on Dispersal and Migration," BioScience 56 (no.5, May 2006): 407-417 (11). Different species, populations, and individuals disperse and migrate at different rates. The rate of movement that occurs in response to changes in climate, whether fast or slow, will shape the distribution of natural ecosystems in the decades to come. Moreover, land-use patterns associated with urban, suburban, rural, and agricultural development will complicate ecosystem adaptation to climate change by hindering migration. Here we examine how vegetation's capacity to disperse and migrate may affect the biophysical and biogeochemical characteristics of the land surface under anthropogenic climate change. We demonstrate

that the effectiveness of plant migration strongly influences carbon storage, evapotranspiration, and the absorption of solar radiation by the land surface. As a result, plant migration affects the magnitude, and in some cases the sign, of feedbacks from the land surface to the climate system. We conclude that future climate projections depend on much better understanding of and accounting for dispersal and migration.

Higgins, Robert R., "Race, Pollution, and the Mastery of Nature". Environmental Ethics 16(1994):281-300. Racial environmental inequities, documented in research over the past ten years, have deep cultural sources in the connections between the concept of social pollution as it has operated in U.S. race relations and the pollution of minority communities, both of which are, in part, the expression of our dominant cultural ethic and project of mastering nature. The project of mastering nature requires the disciplining of "human nature" in a context of social power in order to dominate "outward" or "external" nature for the purposes of production and consumption. In disciplining human nature, our ethics and practices of work and gender have fostered the repression and projection of sensuality, widely construed, onto African-Americans in particular. This racial "other" has been historically segregated in our society through social pollution taboos. Social pollution practices, in turn, facilitate the disproportionate environmental pollution of minority communities by rendering such pollution, like the communities themselves, less visible and therefore less of a threat to white centers of power. This fit between social and environmental pollution is expressed in the notion of "appropriately polluted space." Attempts to understand and correct racial environmental inequities will founder unless these deeper cultural connections are recognized and challenged. Moreover, attempts to redefine an environmentally benign "self" in the American context require that the historical "other" of race be confronted and transcended. Higgins is with the Dept. of Human Ecology, Cook College, Rutgers University. (EE)

Hilborn is at the University of Washington School of Fisheries. Mangel is at the University of California Santa Cruz Department of Environmental Studies.

Hilborn, Ray, et al., "Effective Enforcement in a Conservation Area," Science 314 (24 November 2006):1266. There are two primary approaches to wildlife conservation. (1) Generating economic benefits so that local communities desire to keep the wildlife. (2) Enforcement of protected areas. Within protected areas, there is debate as to whether enforcement can maintain wildlife and even whether protected areas as wildlife reserves are realistic or morally justified. These authors review illegal taking of wildlife in Serengeti National Park, Tanzania. They conclude that antipoaching enforcement is effective for the protection of species, if there are sufficient resources for a professional national park service. Hilborn is in Aquatic and Fishery Sciences, University of Washington, Seattle.

Hildyard, Nicholas, Hines, Colin, Lang, Tim. "Who Competes? Changing Landscapes of Corporate Control", The Ecologist 26(no. 4,1996):125. In the drive to become "competitive", companies are restructuring their operations on a global scale. It is not companies which are competing, however, but workers and communities. New technologies, new management techniques and a new freedom of capital to move across borders have drastically undermined the bargaining power of labor, while strengthening that of corporations. Workers are being pitted against workers and communities against communities as companies relocate from one country to another in search of new markets, the weakest unions, the most flexible rules on working conditions and the largest subsidies. The time has come to press for an economy that protects people, not corporations. (v7,#4)

Hildyard, Nicholas, and Sexton, Sarah. "Too Many for What? The Social Generation of Food `Scarcity' and `Overpopulation,'" The Ecologist 26(no.6, 1996):282. Provisions of population and food supply which leave out the power relationships between different groups of people will always mask the true nature of food scarcity--who gets to eat and who doesn't--and lead to "solutions" that are simplistic, frequently oppressive and which, ultimately, reinforce the very structures creating ecological damage and hunger. Moreover, by degrading the environment, often irreversibly, the forces which are generating organized scarcity--the chief characteristic of "overpopulation" in the modern era--are inexorably undermining the capacity of the land to produce food. In doing so, they threaten to bring about conditions of absolute scarcity where even equitable economic and social arrangements may prove insufficient to prevent widespread human impoverishment. (v8,#2)

Hildyard, Nicholas. "Public Risk, Private Profit: The World Bank and the Private Sector", The Ecologist (1979) 26(no. 4,1996):176. The private sector has long benefited indirectly from aid flows. However, the World Bank and other agencies are not bypassing the state in order to channel development funds direct to private companies. The companies make the profits while the public carries the risks.

Hill, Marquita K., Understanding Environmental Pollution, 2nd ed. New York: Cambridge University Press, 2004. With particular attention to persistent and bioaccumulative pesticides and herbicides, also with emphasis on global pollution. Hill is a biologist (emeritus) at the University of Maine.

Hill, Richard C. and Paul A. Bowen, "Current Issues in Sustainable Construction," in Managing the Environment in Mining and Construction, July 1995, a supplement to EPM, SA Mining World, and SA Construction World. Seven principles for achieving sustainable construction. Minimize resource consumption, maximize resource use; use renewable or recyclable resources, protect the natural environment and restore degraded environments, create a healthy, non-toxic environment, pursue quality

in creating the built environment, and promote labor intensive methods, skills training, and capacity building of local people. With applications to South Africa. Hill is in environmental evaluation, Bowen in construction economics and management at the University of Cape Town. (v6,#3)

Hill, Thomas E., Jr., "Ideals of Human Excellence and Preserving Natural Environments," Environmental Ethics 5(1983):211-224. A truly different and original essay in the field. Rather than focus on the justification of environmental protection through ethical notions such as rights or sentience, Hill focuses on the virtues (and lack thereof) of people who seek to destroy the environment. The essential ethical question is what kind of person do we wish to become, what kind of virtues do we wish to promote? But, Hill must deal with the problem of personal subjectivity: what of people who do not feel that nature is beautiful or awe-inspiring, and thus that nature is unconnected to the virtuous life?

(v.13,#2)

Hill, Thomas E., Jr. "Ideals of Human Excellence and Preserving Natural Environments." Environmental Ethics 5(1983):211-24. The moral significance of preserving natural environments is not entirely an issue of rights and social utility, for a person's attitude toward nature may be importantly connected with virtues or human excellences. The question is, "What sort of person would destroy the natural environment--or even see its value solely in cost/benefit terms?" The answer I suggest is that willingness to do so may well reveal the absence of traits which are a natural basis for a proper humility, self-acceptance, gratitude, and appreciation of the good in others. Hill is at the University of California, Los Angeles, CA. (EE)

Hinchman Lewis P. , and Sandra K. Hinchman, "What We Owe the Romantics," *Environmental Values* 16(2007): 333-354. Romanticism is recognized as a wellspring of modern-day environmental thought and enthusiasm for nature-preservation, but the character of the affinities between the two is less well understood. Essentially, the Romantics realised that nature only becomes a matter for ethical concern, inspiration and love when the mind and sensibility of the human observer/agent are properly attuned and receptive to its meaning. That attunement involves several factors: a more appropriate scientific paradigm, a subtler appreciation of the impact that the setting of human dwelling, especially landscape, may have on character; the discovery of 'life' and spontaneity as a motif in science and art; a deeper and more complex sense of time; and a feel for place drawn from the life-world rather than physics or economics. Romanticism invented a new language and set of descriptions to illuminate all of these things, one we neglect or forget at our peril. Lewis Hinchman is in political science, Clarkson University, Potsdam, NY. Sandra Hinchman is in the Department of Government, St. Lawrence University, Canton, NY.

Hinchman, Lewis P., "Is Environmentalism a Humanism?" Environmental Values 13(2004):3-29 Environmental theorists, seeking the origin of Western exploitative attitudes toward nature, have directed their attacks against 'humanism'. This essay argues that such criticisms are misplaced. Humanism has much closer affinities to environmentalism than the latter's advocates believe. As early as the Renaissance, and certainly by the late eighteenth century, humanists were developing historically-conscious, hermeneutically-grounded modes of understanding, rather than the abstract, mathematical models of nature often associated with them. In its twentieth-century versions humanism also shares much of the mistrust of consumerism, instrumental reason, and 'worldlessness' that marks environmentalist literature. Nevertheless, humanism is indeed committed to the principle that human beings are and ought to be free, and opposes theoretical approaches that suppress freedom. Reconciling humanism and environmentalism thus involves two steps: resisting the former's tendency to treat nature and freedom as metaphysical polarities, and drawing environmental theory away from flirtation with

deterministic, biologicistic worldviews. The essay concludes by suggesting Aldo Leopold's A Sand County Almanac as the paradigm case of environmental thought with roots in humanist approaches. Hinchman is at Clarkson University, Potsdam, NY. (EV)

Hinrichs, C. Clare, and Patricia Allen, "Selective Patronage and Social Justice: Local Food Consumer Campaigns in Historical Context," *Journal of Agricultural and Environmental Ethics* 21(2008):329-352. In the early 2000s, the development of local food systems in advanced industrial countries has expanded beyond creation and support of farmers' markets and community supported agriculture farms and projects to include targeted Buy Local Food campaigns. Non-governmental groups in many U.S. places and regions have launched such campaigns with the intent of motivating and directing consumers toward more local food purchasing in general. This article examines the current manifestations and possibilities for social justice concerns in Buy Local Food campaigns, by considering them within the more general category of "selective patronage" campaigns. Historical campaign examples, such as Buy Union, Buy American, and Buy Black campaigns, offer instructive comparisons to contemporary consumer campaigns promoting local food. Through examining the construction of threats, intended beneficiaries, products to be avoided, and those to be preferentially selected, the paper demonstrates how selective patronage campaigns have emphasized social justice needs and concerns for designated groups in ways that have been potentially exclusionary of other disadvantaged groups and thus undermining of social justice more broadly. As a contemporary instance of "selective patronage," Buy Local Food campaigns exhibit similar contradictory impulses, which are intensified by the conceptual and practical pitfalls in designating "local." The article concludes by considering how the challenges and prospects for commitments to social justice in local food consumer campaigns reinforce the importance of emerging initiatives centered on domestic fair trade. The authors are in the Department of Agricultural Economics and Rural Sociology, The Pennsylvania State University, University Park, PA.

Hirt, Paul W., A Conspiracy of Optimism: Management of the National Forests Since World War Two. Lincoln: University of Nebraska Press, 1994 (available end of summer). A historical study of how public values, scientific ideology, and political economy have influenced U.S. national forest management, focusing especially on the changing concepts of sustained yield and multiple use. The author critically analyzes various social, political, and economic factors that have blocked the achievement of "sustainable" resource extraction and protection of non-market environmental values in the national forests. A post-World War Two natural resource instrumentalism, combined with an economic prosperity ethics, and state-sponsored corporate welfare economics provides the foundation for what the author calls a "conspiracy of optimism" that cloaked forest depletion and ecological degradation behind a facade of "can do" technological optimism. Hirt is an environmental historian at Washington State University. (v4,#4)

Hiskes, Richard P., Democracy, Risk, and Community. Oxford: Oxford University Press, 1998. Opposed to most theories of risk that focus on individual decision makers and models of rational choice, Hiskes argues that risks must be seen as emergent and political phenomena. Risks resist reduction to single actors. To make policy for risks, environmental risks, included, one needs to connect persons socially and politically. Hiskes is at the University of Connecticut. "Assisted Colonization and Rapid Climate Change." *Science* Vol. 321, no. 5887 (18 July 2008): 345-46. In view of global warming, moving species outside their historic ranges may mitigate loss of biodiversity. Endangered species need "assisted colonization," humans who move them to new locations. The lead author is at the University of Queensland, Australia.

Hoff, Christina. "Kant's Invidious Humanism." *Environmental Ethics* 5(1983):63-70. In Kant's philosophy nonrational beings are denied moral standing. I argue that Kant's rational humanism is arbitrary and morally impoverished. In particular I show that Kant moves illegitimately from the first formulation of the categorical imperative (which makes no mention of a moral domain) to the second (which limits moral recognition to rational beings). The move to the second formulation relies on a new and unsupported principle introduced by Kant: rational nature and only rational nature exists as an end in itself. Hoff is at the Philosophy Dept., Clark University, Worcester, MA. (EE)

Hoffert, Martin I. et al (two dozen others). "Advanced Technology Paths to Global Climate Stability: Energy for a Greenhouse Planet," *Science* 298(1 Nov. 2002):981-987. A survey of possible future energy sources that are carbon dioxide free: terrestrial solar and wind energy, solar power satellites, biomass, nuclear fission, nuclear fusion, and fossil fuels from which carbon has been sequestered. All of these approaches currently have severe deficiencies. A broad range of intensive research and development is

urgently needed to produce technological options that can allow both climate stabilization and economic development. A technofix article, with doubts. (v.13,#4)

Hoffert, Robert W. "The Scarcity of Politics: Ophuls and Western Political Thought." Environmental Ethics 8(1986):5-32. William Ophuls has argued that the sources of and solutions for present scarcity conditions are to be found in Western political philosophy. I clarify various theoretical issues raised by Ophuls' work and offer conceptual alternatives regarding some of the more basic issues. Specifically, I critique the Lockean and Hobbesian elements in Ophuls' treatment of the role of liberal democracy, with special attention to abundance assumptions and Lockean individualism. I also argue that he fails to deal adequately with resource distribution in his treatment of resource scarcity, that he improperly removes man from nature, that he misunderstands the relationship of technology and politics, and that he encounters other difficulties in terms of the public/private distinction and in integrating micro and macro issues. Ironically, Ophuls' admirable attempt to shed light on the critical relationship between scarcity conditions and political philosophy may have created a new and disorienting set of shadows. Hoffert is Associate Dean of the College of Arts, Humanities, and Social Sciences, Colorado State University, Fort Collins, CO. (EE)

Hoffman, Joan, "Economic Stratification and Environmental Management: A Case Study of the New York City Catskill/Delaware Watershed," Environmental Values 14(2005): 447-470. Long run success in watershed management requires understanding of how economic stratification and social values affect water quality protection. Feedback effects on water quality are produced by three aspects of economic well-being: income levels, quality of life and inequality, including the effects of gender based inequality. In the US emphasis on individualistic values leads to reliance on local and private policy solutions to social problems. Analysis of the context of New York City's internationally famous watershed agreement with communities 120 miles distant provides a case study of these relationships. The nature of economic stratification in these upstate communities and the insufficient response of social policies were an impediment to achieving New York City's water quality goals. As a consequence the City's watershed agreement contains direct economic aid to Watershed communities. The Agreement does not address all stratification issues. Some call for solutions beyond the local level and an approach that benefits from the European emphasis on community. It is in the interest of watershed managers to broaden the scope of their concerns to understand and support state and national programs which address problems created by economic stratification. The expansion of the European Union increases the relevance of these lessons for Europe. Hoffman is in economics, John Jay College of Criminal Justice, New York, New York. (EV)

Hoffman, W. Michael, "Business and Environmental Ethics," Business Ethics Quarterly 1(no. 2,

1991):169-184. Argues for biocentrism in environmental ethics. Business has obligations to protect the environment over and above what is required by law. There is danger in "good ethics is good business" as a basis for environmental ethics in business, and both business and environmentalists need to be wary of this. Business and environmental ethicists ought to promote deeper moral perspectives than ones based on mere self-interest or human interest. The environmental movement must find ways by which business can incorporate and protect the intrinsic value of animal and plant life and other natural objects that are integral parts of ecosystems. This article was originally the president address to the Society for Business Ethics, August 1990. (v2,#4)

Hoffman, W. Michael, Robert Frederick, and Edward S. Petry, Jr., eds., Business, Ethics, and the Environment (New York: Quorum Books, 1990). (v2,#1)

Hoffman, W. Michael, (Philosophy, Bentley College, Waltham, MA) in a presidential address to the Society for Business Ethics, meeting in San Francisco, August 10, linked business ethics and environmental ethics. The paper was titled, "Business and Environmental Ethics" and argued for the responsibility of business to a much larger group than its own stakeholders. He proposed that "naturalistic ethical guidelines such as those suggested by Holmes Rolston should be set forth for business to follow when its activities impact upon ecosystems." These guidelines are in Rolston's "Just Environmental Business," Chapter 11, in Tom Regan, ed., Just Business (Random House, 1984), a college text in business ethics. (v1,#3)

Hoffman, W. Michael, Robert Frederick, and Edward S. Petry, Jr., eds. Business, Ethics, and the Environment: The Public Policy Debate and The Corporation, Ethics, and the Environment. New York: Quorum Books, 1990. Both of these volumes collect papers from the Eighth National Conference on Business Ethics sponsored by the Center for Business Ethics at Bentley College. The papers are a mix of scholarly papers from several disciplines (public policy, law, business administration, business ethics, and environmental ethics) and more informal "after dinner" speeches by chief executives in industry and environmental organizations. In the first volume, the chief papers on environmental ethics are by Mark Sagoff, David Hanson, Thomas Slaughter, Jack Weir, Eric Katz, and Thomas White. The second volume contains articles by Edwin Hettinger, Laura Westra, Peter French, Kenneth Goodpaster, Norman Bowie, and Lisa Newton. Hettinger's chapter on the subject of "eco-sabotage" is one of the few rigorous treatments of the subject. (Katz, Bibl # 2)

Hoffmann, Stanley. The Ethics and Politics of Humanitarian Intervention. Notre Dame: University of Notre Dame Press, 1996. 168pp. \$25 cloth \$14.95 paper. The problems of humanitarian intervention in international relations. Includes responses by Robert C. Johansen and James Sterba, an introductory essay by Raimo Vayrynen. (v7,#4)

Hoge, Warren, "The Fox Hunt Is Hounded, But Won't Turn Tail," New York Times (4/10/97): A4. Hunting in England to Be Outlawed? By a vote of 411-151, the British House of Commons passed the second reading of a bill that would ban hunting of foxes and other wildlife (e.g., deer, hare, and mink). However, Prime Minister Tony Blair, who says he supports the ban, has not provided time on the parliamentary agenda for it to clear the hurdles necessary for passage. (v.8, #4)

Hoge, Warren, "Norway's Awesome Nature, Awesomely Overcome," New York Times (8/28/98): A4. Norway fights flight to cities with rural highway projects. In an effort to keep people living in its rugged rural areas, Norway is building tunnels to some of the world's most remote locations. Recent additions to Norway's nearly 3,000 miles of tunnels include the deepest tunnel in the world (870 feet below sea level), which connects an island of 4,000 people to the mainland, and the longest tunnel in the world (15.2 miles), which links two towns with populations of 2,000 each. Many Norwegians see themselves as "pastoral dwellers" and "self-sufficient rustics," and desire to preserve their traditional settlement patterns. In addition to building rural infrastructure, the country provides incentives for rural living in the forms of unconditional per-inhabitant grants to local governments, tax exemptions for local businesses, increased child benefits payments, and funds to assist start-up enterprises. Hogue, Cheryl, "A Smaller Right to Know," Chemical and Engineering News 83(no. 44, 2005):22-25. The U.S. Environmental Protection Agency plans to reduce required emissions reports to every other year and to allow more facilities to submit less information. Every year at present, as required by the Emergency Planning and Community Right-to-Know Act, EPA amasses a Toxics Release Inventory (TRI) and makes it public. The proposed change is to do this every other year and also to provide smaller amounts of information particularly for facilities that handle or release smaller amounts of toxics. The change is advocated as a paperwork burden reduction. The two major chemical manufacturing trade groups are backing the change. DuPont meanwhile says they will continue to compile and release data annually, whatever the EPA requirement, because they are committed to transparency. TRI reports have been required since 1989 and during that period chemical producers have cut their releases 65%. One reason environmentalists are concerned is that it makes tracking trends more difficult. Trends typically require three or more sets of data, and this would double the time required to document a trend. Currently a facility can use a short form of reporting if they release less than 500 pounds a year of chemicals, with the exception of PBT substances (lead, mercury, dioxins, and polychlorinated biphenyls). EPA is proposing to raise that threshold to less than 5,000 pounds a year.

Holbrook, Daniel, "Utilitarianism on Environmental Issues Reexamined," The International Journal of Applied Philosophy 7 (no. 1, 1992):41-46. There are two very different versions of utilitarianism. Qualitative utilitarianism gives strong support to environmental preservation, while preference utilitarianism does not. Qualitative utilitarians claim that the environment may be compromised only when it is clearly in the long-term interests of raising the quality of life for humans--where quality of life is given as true and objective standard as possible. A theory that tell us, "Never compromise the environment!" must be inadequate. Holbrook teaches philosophy at Washington State University.

Holbrook, Daniel, "The Consequentialistic Side of Environmental Ethics," Environmental Values 6(1997):87-96. ABSTRACT: There are two principles often found in environmental ethics self-realisation and environmental preservation. I argue that these are two logically independent principles. An analysis of its essential features shows that the preservation principle should be based on actual consequentialism, for it is only the actual effects of our actions and policies that are important to the main issues of environmental preservation. Aldo Leopold's land ethic is found to be an example of a consequentialistic theory of environmental preservation. Department of Philosophy

Holbrook, Daniel, "Deep Ecology: Fact, Value, or Ideology?" Methodology and Science (Netherlands) 23(no. 3, 1990):130-141. Deep ecology rests on a confusion of (1) facts made apparent by advances in environmental science, (2) values based on the aesthetic appreciation of nature, and (3) a desire to preserve the healthfulness of the world we live in. Deep ecology is an ideology. Environmentalists ought to see the effects of human civilization in a different light, not with the self-righteous disgust many of them express, but as the logical outcome of desires that come naturally to humans. An important part of deep ecology is cultivating ecological consciousness, which can be better achieved through the mutual development of values than through the deception of ideology. Holbrook teaches philosophy at Washington State University.

Holden, Constance, "Kenyan Edict Threatens Famed Park," Science 310(14 October 2005):215. Kenya's President Mwai Kibaki has announced that Amboseli National Park, one of the nation's prime wildlife reserves, will be turned over to local Maasai control, removing it from the Kenyan Wildlife Service, which has run the park since 1974. Conservation groups, along with David Western, former Kenyan Wildlife Service director, say the move is political, to curry favor with the Maasai people, but that it will result in destruction of the park. Amboseli's elephants number about 1,400, and already the Maasai have moved 15,000 cattle to graze in the park. The Park has been the most remunerative in Kenya, bringing in \$ 3.4 million from tourism last year. But recent tourists are already saying that they didn't come to Kenya to see cattle.

Holden, Constance, "Researchers Pained by Effort to Define Distress Precisely," Science 290 (24 November 2000):1474-1475. Animal researchers pained by effort to define animal stress. The Animal Welfare Act requires the U.S. Department of Agriculture "to minimize pain and distress" in animals used in research, and USDA officials, wondering whether they have focused too much on pain and not enough on distress, have a study in progress. Their working definition of "distress" is "a state in which an animal cannot escape from or adapt to the internal or external stressors it experiences, resulting in negative effects on its well-being." Animal welfare advocates favor further regulation concerning stress. Some scientists oppose it, others favor it. But deciding between stress and distress is difficult. (EE v.12,#1)

Holden, Constance, "Life Without Numbers in the Amazon," Science 305(20 August 2004):1093. The Piraha, a hunter-gatherer tribe of about 200 people, live in small villages on a tributary of the Amazon. They have one of the world's most phonemically limited languages, with just ten consonants and vowels. They have no words for numbers beyond two, and (so anthropologists claim) the ability to conceptualize numbers is no better than it is among pigeons, chimps, or human infants. (v. 15, # 3)

Holden, Meg. "Phenomenology versus Pragmatism: Seeking a Restoration Environmental Ethic." Environmental Ethics 23(2001):37-56. In this paper, I challenge the work of David Abram, who makes a case for phenomenology as the only philosophical tradition amenable to restoring balanced human-nature relationships. While phenomenology provides a useful conceptual framework for understanding the environmental ethics of oral cultures, this paper considers the tradition of American pragmatism to be more applicable to the environmental task at hand: devising an environmental ethic of reform for modern, capitalist, Western culture. The application of phenomenology and pragmatism to environmental ethics is compared according to four main philosophical questions: the essential uncertainty of life, the existence of a human/nature divide, the necessary conditions for claiming truth, and the relative role of metaphysics or imagination and that of science in relating to the world. Holeck, K. T., Mills, E. L., MacIsaac, H. J., Dochoda, M. R., Colautti, R. I. and Ricciardi, A., "Bridging Troubled Waters: Biological Invasions, Transoceanic Shipping, and the Laurentian Great Lakes," BioScience 54(no. 10, 2004): 919-929(11). Release of contaminated ballast water by transoceanic ships has been implicated in more than 70 of faunal nonindigenous species (NIS) introductions to the Great Lakes since the opening of the St. Lawrence Seaway in 1959. Contrary to expectation, the apparent invasion rate increased after the initiation of voluntary guidelines in 1989 and mandatory regulations in 1993 for open ocean ballast water exchange by ships declaring ballast on board (BOB). However, more than 90 of vessels that entered during the 1990s declared no ballast on board (NOBOB) and were not required to exchange ballast, although their tanks contained residual sediments and water that would be discharged in the Great Lakes. Lake Superior receives a disproportionate number of discharges by both BOB and NOBOB ships, yet it has sustained surprisingly few initial invasions. Conversely, the waters connecting Lakes Huron and Erie are an invasion hotspot despite receiving disproportionately few ballast discharges. Other vectors, including canals and accidental release, have contributed NIS to the Great Lakes and may increase in relative importance in the future. Based on our knowledge of NIS previously established in the basin, we have developed a vector assignment protocol to systematically ascertain vectors by which invaders enter the Great Lakes. (v.14, #4)

Hood, Robert. "Rorty and Postmodern Environmental Ethics: Recontextualizing Narrative, Reason, and Representation." Environmental Ethics 20(1998):183-93. Richard Rorty's pragmatic abandonment of epistemological representationalism has important implications for environmental ethics, particularly postmodern environmental ethics. I discuss Rorty's position and show that Mark Sagoff's version of it allows for both rational negotiation of public environmental issues and for the creation of solidarity

among people regarding the environment. I then discuss Eugene Hargrove's view that representation, rather than being implicated in the destruction of nature, is a key element in preserving (the intrinsic value of) nature. I conclude that Hargrove's position is compatible with Rorty's and Sagoff's positions and I argue that aesthetic representation may still be needed in a postmodern world that has abandoned epistemological representationalism. Hook, Bill. "Intrinsic Value: Under the Scrutiny of Information and Evolutionary Theory." Environmental Ethics 25(2003):359-373. We do not yet have a sound ontology for intrinsic value. Albert Borgmann's work on information technology and Daniel Dennett's thoughts on evolutionary theory can provide the basis for an account of intrinsic value in terms of what it is, how it comes into existence, where it is found, and whether it can be quantified or compared. Borgmann's information and realization relations are cornerstones for understanding value. According to Borgmann, things are valuable when they are meaningful and things become meaningful as information and realizations. It is in these relations that intrinsic and extrinsic values find their common roots. Dennett's musing on the relationship between DNA instructions, DNA readers, and phenotypes invites a commingling of information technology and evolutionary theory. His notion of design space provides a basis for the claim the biotic community has on intrinsic and extrinsic values. (EE)

Hopkins, Patrick D., "Value, 'Nature', and Copies of 'Nature'", Center for Values and Social Policy Newsletter (Center for Values and Social Policy, University of Colorado), vol 16, no. 2, fall 1997. (Campus Box 232, Boulder, CO 80309). "While I simply have to accede to the fact that some people value things because they have not been shaped by human hands, and thus will always perceive the 'artificial' as less valuable, this psychological and moral reaction means nothing for the 'artificial' object in and of itself. It only points to the existence of anthropocentric cultural forces that attach metaphysical and moral taint to human-made objects. ... The analysis at least suggests that there is nothing inherently misguided or anti-environmentalist in high-tech restoration ecology projects. And, that there is nothing anti-environmentalist about thinking that an 'artifact' can be as good as 'nature'." Thinking that the artifacted forest is of less value than the natural is "seriously flawed." Hopkins is a visiting faculty member in philosophy at the University of Colorado. (v.8,#4)

Hopkins, Patrick D., and Austin Dacey, "Vegetarian Meat: Could Technology Save Animals and Satisfy

Meat Eaters?" *Journal of Agricultural and Environmental Ethics* 21(2008):579-596. Between people who unabashedly support eating meat and those who adopt moral vegetarianism, lie a number of people who are uncomfortably carnivorous and vaguely wish they could be vegetarians. Opposing animal suffering in principle, they can ignore it in practice, relying on the visual disconnect between supermarket meat and slaughterhouse practices not to trigger their moral emotions. But what if we could have the best of both worlds in reality—eat meat and not harm animals? The nascent biotechnology of tissue culture, originally researched for medical applications, holds out just such a promise. Meat could be grown in vitro without killing animals. In fact, this technology may not just be an intriguing option, but might be our moral obligation to develop. Hopkins is in the Department of Philosophy, Millsaps College, Jackson, MS. Dacey is at the Center for Inquiry, New York, NY.

Horgan, John, "From Complexity to Perplexity," *Scientific American* 272(no. 6, 1995):104-109. Many scientists are beginning to doubt whether there can be a unified theory of complex systems, and even whether there can be a science of complex systems. At least natural complex systems may be too contingent, or open, or complex, either for there to be a science of them, or, if they are more regular, for our minds to grasp that science. About computer models of natural systems, such as evolutionary natural history or ecosystems, there is considerable doubt. With particular focus on the Santa Fe Institute and studies there. Horgan is a senior writer for *Scientific American*. (v.8,#4)

Horn, Eric B. "On Callicott's Second-Order Principles." *Environmental Ethics* 27 (2005):411-428. J. Baird Callicott has proposed two second-order principles which he believes can be used to settle conflicts between his land ethic and traditional human morality. The first of these proposes that ethical obligations arising from "more venerable and intimate" communities should take precedence over those arising from "more recently emerged and impersonal" communities, while the second proposes that "stronger" interests should take precedence over "weaker" ones. Callicott's first second-order principle fails to specify unambiguously which communities' obligations should take precedence because he has failed to provide a clear description of how we are to identify and compare communities. In order for his second second-order principle to be useful, a good deal more work needs to be done to spell out what is meant by describing certain interests as "stronger" than others, particularly with respect to holistic entities. While the project of fleshing out a description of the strengths of interests for holistic entities may present an interesting and fruitful challenge, the prospects for providing a description of community identification of the sort that Callicott requires are much dimmer. Hösle, Vittorio, Philosophie der ökologischen Krise (Philosophy of the Ecological Crisis). München: Moskau Vorträge. Beck'sche Reihe. 1991. 151 pages. DM 16,80. ISBN 3 406 34024 5. Five lectures, introductory in character: I. Ecology as a New Paradigm for Politics. II. The Historical Roots of the Ecological Crisis. III. Ethical Consequences of the Ecological Crisis. IV. Economics and Ecology. V. Political Consequences of the Ecological Crisis. Like Hans Jonas, to whom Hösle dedicates his book, Hösle believes that a fundamental shift in values is called for, a shift toward the recognizing the absolute, non-relational value of nature. This consists in nature's teleology. At the same time, human teleology is, on account of its subjectivity, morally superior to the more simple forms of teleology found in the rest of nature, and humanity has an absolute duty to ensure its own further existence. These lectures were first presented at the Institute for Philosophy of the USSR Academy of Science in Moscow in 1990. Born in Milan in 1960, Hösle holds a full professorship in Essen, and is one of the youngest such philosophers in

Germany. (Thanks to Angelika Krebs, Johann Wolfgang Goethe-Universität, Frankfurt/Main.)

Hospers, John, Human Conduct: Problems of Ethics, 3rd edition. Fort Worth, TX: Harcourt Brace, 1996. In this new edition of a longstanding ethics text, Hospers has added a chapter (Chapter 8) on "Animal Rights," which is a five-way dialogue among proponents of animal rights, animal liberation, environmentalists, and others. Maybe the fourth edition will see fit to separate out environmental ethics from animal rights. Hospers teaches philosophy at the University of Southern California. (v7,#1)

Houde, Lincoln J., Connie Bullis. "Ecofeminist Pedagogy: An Exploratory Case," Ethics and the Environment 4(1999):143-174. For ecofeminists within academic contexts, the class room is another "contested terrain" where transformative eco-cultural work should be integrated. In our case, we are a part of communication studies and try to adopt ecofeminist insight as a position for questioning dominant discourses and practices. To do this we "incorporate popular culture as a serious object of politics and analysis" (Giroux 1997, 148). It is our hope that popular culture can be used as an ecofeminist tool for interrupting hegemonic power relations and encouraging critical-relational consciousness. This paper reports an exploratory, effort aimed at combining ecofeminist critiques with popular culture to employ, an ecofeminist pedagogy. It begins with an ecofeminist critique of the "animal-industrial-complex" (Noske 1989). In this critique, discursive moral agents are situated within the anthropocentric and androcentric culture (Payne 1994). It then articulates an ecofeminist teaching philosophy and describes how that philosophy was applied in one case using an episode from a prime time television cartoon. Finally, it draws conclusions about what is accomplished through this exploratory case. The authors are in the Department of Communication, University of Utah, Salt Lake City. (E&E)

Houlgate is in philosophy at the University of Warwick. (v.9,#4)

Hourdequin, Marion. "Doing, Allowing, and Precaution." *Environmental Ethics* 29(2007):339-358. Many environmental policies seem to rest on an implicit distinction between doing and allowing. For example, it is generally thought worse to drive a species to extinction than to fail to save a species that is declining through no fault of our own, and worse to pollute the air with chemicals that trigger asthma attacks than to fail to remove naturally occurring allergens such as pollen and mold. The distinction between doing and allowing seems to underlie certain versions of the precautionary principle, and insofar as the precautionary principle rests on this distinction, it diverges from direct consequentialist approaches to risk management. There are two ways in which such reliance on the doing/allowing distinction may be defended: by appeal to indirect consequentialist considerations, and by appeal to deontological considerations. Neither approach is unproblematic; however, retention of a distinction between doing and allowing in environmental policy is consistent with the widespread intuition that there is something *prima facie* valuable about the world as we find it. Howard, Don. "Commoner on Reductionism." Environmental Ethics 1(1979):159-76. Barry Commoner has argued that the environmental failure of modern technology is due in large part to the reductionistic

character of modern science, especially its biological component where the reductionist approach has triumphed in molecular biology. I claim, first, that Commoner has confused reduction in the sense of the reduction of one theory to another with what is better called analysis, or the strategy of breaking a whole into its parts in order to understand the properties of the whole, this latter being the actual target of his attack. I then argue that his criticisms of molecular biology fail since each of the properties of the cell which he claims cannot be understood in an analytic fashion, such as reproduction, development and inheritance, can be so understood, and that, in fact, each of his putatively nonanalytic accounts of these properties is the result of analysis. Similarly, Commoner's claim that ecosystems possess properties that cannot be understood analytically is refuted by comparing ecosystems with automobiles, which Commoner acknowledges are susceptible to analysis, and by showing that there are no essential differences between the two. Finally, I observe that while it is false that ecosystems cannot be understood in analytic terms, it is true that they are not usually thus understood, and that the explanation for this is not that scientists subscribe to a mistaken philosophy, but that our social institutions for the teaching and application of science do not adequately stress the importance of exploring the connections between the parts of such complex wholes. Howard, John A. and Kirby C. Donnelly, "A Quantitative Safety Assessment Model for Transgenic Protein Products Produced in Agricultural Crops," Journal of Agricultural and Environmental Ethics 17(2004):545-558. Transgenic plants are now being used to develop pharmaceutical and industrial products in addition to their use in crop improvement. Using confinement requirements, these transgenic plants are grown and processed under conditions that prevent intermixing with commodity crops. Regulatory agencies in the United States have provided guidance of zero tolerance of these new industrial crops with commodity crops. While this is a worthy goal, it is theoretically unattainable. In spite of the best containment practices, there is a potential risk using any system of production due to unforeseen incidences including natural disasters or exposure to workers. The precautionary principle has been used for numerous regulated articles in addressing the potential risks of new products and technology based on a risk assessment in similar situations. We present here a risk assessment model that could be used as a start to develop an accepted model for the industry. The model is based on current risk models used for other regulated articles, but adapted for these types of products. This could be used to determine action levels in the event of an unintended exposure or to ensure that detection or confinement methods are adequate to avoid risks. As an example, aprotinin, a therapeutic protein now being produced in maize, was evaluated for potential risk to humans using this model. Keywords: aprotinin industrial enzymes, maize, pharmaceuticals, plants, risk, transgenic. The authors are at College Station, Texas. (JAEE)

Howard, Walter E., "Animal Research is Defensible," Journal of Mammalogy 74(no.1, 1993):234-35. Howard argues that using animals for research, teaching, as food, and so forth is morally permissible since we treat animals less badly than does nature. Animal rights positions, he claims, are based on ignorance concerning nature's brutality. (v5,#1)

Howard, Walter E., "Nature's Death Ethic," BioScience 42(1992):739. "Nature, though beautiful, is a tough arena, with a cruel and brutal death ethic of the survival of the fittest." "Responsible use of animals is biologically sound and fits well into the natural scheme of life." "Our ethics should not be against killing per se, for nature's death ethic incorporates necessary killing by practically all animals, but our ethics should be against inflicting unnecessary pain and distress to animals." "There is still a need for a gentler, kinder existence for both domestic and wild animals in habitats people have modified. Proper management of population densities and preserving habitats are constructive ways to help minimize the suffering wild animals continually face in modified environments when exposed to the law of fang and claw." A useful editorial for discussion in environmental ethics classes and in discussions of animal welfare. Howard is in wildlife and fisheries biology at the University of California, Davis. (v4,#4)

Howard, Walter E., "Animal Research Is Defensible," Journal of Mammalogy 74(1993):234-235. A death ethic is essential to nature and animal rights advocates fail to appreciate this. The most important purpose in life for animals, except for trying to breed, is to serve as food to another, usually of a different species. People are an unusually efficient predator and much more humane than nature. They create the lives they destroy, treat them humanely, and replace them with other such lives. There is an ethical right for humans to use animals responsibly in research, for food, as game, and for recreation, as long as unnecessary pain is not inflicted. The killing of wild and laboratory animals can be justified morally and considered a sacred act. Howard is in wildlife at the University of California, Davis. (v5,#4)

Howarth, J. M. "The Crisis of Ecology: A Phenomenological Perspective." Environmental Values 4(1995):17-30. If we are to act properly with regard to the natural world, to protect, preserve, conserve, manage or leave it alone, we need both appropriate knowledge of that world, and a sound foundation for values to guide our actions. The thesis of this paper is that scientific ecology, though some of its interpreters claim it as a 'post-modern' eco-friendly science, in fact, while perhaps not as guilty as other of its post-modern interpreters might claim of the worst excesses of 'modernism', nonetheless does retain the underlying assumptions of modernism. (The 'jargon' will be further explained.) The thesis will be supported by methods drawn from phenomenology. Phenomenological enquiry can reveal and criticise the modernist assumptions, while traditional phenomenological notions, in particular Heidegger's notion of Dwelling and Merleau-Ponty's notion of the body subject, I shall suggest, might form a more eco-friendly framework for enquiring into the character of interactions within the natural world and the basis of values in those interactions. KEYWORDS: Phenomenology, ecology, modernism, symbiosis, niche Howarth is in the philosophy department, University of Lancaster. (EV)

Howarth, Richard B., "Intergenerational Justice and the Chain of Obligation." Environmental Values Vol.1 No.2(1992):133-140. ABSTRACT: The actions and decisions taken by the present generation will affect not only the welfare but also the composition of future generations. A number of authors have used this fact to bolster the conclusion that the present is only weakly obligated to provide for future welfare since in choosing between futures of poverty and abundance, we are not deciding the welfare of a well-defined group of future persons but instead deciding which set of potential persons--the poor or the rich--will become actual. Provided that future generations have lives that are worth living, they will be grateful to us for bringing them into existence--or so the argument goes. In this paper, I argue that this position overlooks an important aspect of the intergenerational problem. We are obligated to provide for the actual children of today, who will in turn be obligated to provide for their children, and so forth from generation to generation. A chain of obligation is thus defined that stretches from the present into the indefinite future, and unless we ensure conditions favourable to the welfare of future generations, we wrong our existing children in the sense that they will be unable to fulfill their obligation to their children while enjoying a favourable way of life themselves. KEYWORDS: Intergenerational justice, obligations to future generations. Energy and Environment Division, Lawrence Berkeley Laboratory, Berkeley, CA 94720, USA.

Hrdy, Sara Blaffer, Mother Nature: A History of Mothers, Infants, and Natural Selection. New York: Pantheon, 1999. Babies are naturally selected to be adorable, and every trait--plumpness, cuteness--that increases adorability increases the infant's chances of survival, inducing the mother to give up bodily resources, subordinating her own aspirations to the interest of the infant. Mothers have a head start in this seduction by the infant, but fathers come soon after. Hrdy, known for her work on primate behavior, taught anthropology at the University of California, Davis. (v10,#4)

Hrdy, Sara Blaffer, Mother Nature: A History of Mothers, Infants, and Natural Selection. New York: Pantheon, 1999. Also Ballantine Books. Another subtitle is: Maternal Instincts and How They Shape the Human Species. What human mothering has in common with (other) primate mothering (and other animals). Women are biologically programmed for mothering. Babies are naturally selected to be adorable, and every trait--plumpness, cuteness--that increases adorability increases the infant's chances of survival, inducing the mother to give up bodily resources, subordinating her own aspirations to the interest of the infant. Mothers have a head start in this seduction by the infant, but fathers come soon after.

Critics, feminist among them, worry that the parallels, however important, fail to recognize the relevant moral differences, and that this may be another case of expecting too much from primates as models for human behavior. Hrdy, known for her work on primate behavior, taught anthropology at the University of California, Davis. (v.11,#1,#2) Reviewed by A. Madgalena Hurtado in Science 287(2000):433-434. Hrdy follows a currently fashionable feminist interpretation, and gives too much credit to grandmothers and too little to fathers as caretakers of infants.

Hricko, Andrea, "Environmental Problems behind the Great Wall," Environmental Health Perspectives 102 (no. 2, February, 1994):154-159. China's two most serious problems are air pollution and water pollution; it is difficult for most Chinese to escape the adverse effects of pollution, judged for better or worse to be an acceptable cost of progress. An official report says, "As a developing country, China must unswervingly give first priority to her national economic development. ... Environmental protection ... must serve the purpose of promoting economic progress and improving the quality of life."

Hughes, J. Donald, "Francis of Assisi and the Diversity of Creation," Environmental Ethics 18(1996):311-320. Francis' s view of nature has been seen as positive in an ecological sense even by those who are for the most part critical of Christianity's attitude to nature, such as Lynn White, Jr. I argue that one element of Francis's uniqueness was that he saw the diversity of life as an expression of God's creativity and benevolence and attempted to carry out that vision in ethical behavior. Much of what has been written about him has precedents in traditional hagiography, but there remains an unmistakable impression of originality. It has been noted that Francis insisted on the goodness of creation, used terms of family relationship to refer to creatures other than human, and preached to them. However, another element has escaped notice: his emphasis on the presence of God in the diversity of created entities and his desire that humans should rejoice in this diversity and glorify God for it and with it. His devotion did not immediately dissolve multiplicity into oneness, but glorified God in each created being and delighted in their individuality. He advocated that praise be expressed by acting in ways consistent with respect for created diversity, not only by observing a strict rule of abstaining from harm to living beings, but also in positive treatment of all creatures. Nature took its meaning not from its serviceability to mankind, but from its expression of the multiple forms of God's benevolent presence. Hughes is in history, University of Denver, Colorado. (EE)

Hughes, J. Donald. "The Environmental Ethics of the Pythagoreans." Environmental Ethics 2(1980):195-213. Two conflicting tendencies may be discerned in Pythagorean ethics as applied to the environment: on the one hand, a sense of reverence for nature and kinship with all life that opposed killing and other forms of interference in the natural world, and on the other hand, a doctrine of the separability of soul and body which denigrates the body and the external world of which it is a part. The prescriptive content of Pythagorean ethics includes prohibitions against taking life, even in sacrifices to the gods, and against eating anything that has been killed. Pollution of certain kinds is forbidden. These strictures were based on an organic, cyclical view of the world, emphasizing its harmony and balance. The Pythagoreans investigated some questions that would today be called ecological. Perhaps most importantly, they evinced a genuine respect for living things, deriving in part from the belief that animals and plants contain the reborn souls of human beings. These doctrines may have been derived from the attitudes and practices of ancestral hunters and gatherers in southeast Europe, with traditional Greek religion serving as the means of transmission from tribal cultures to classical philosophy. The followers of Pythagoras split into two schools: a "scientific" school that neglected biology and therefore ecology, and a "religious" school that emphasized purity of soul and rejected any concern with physical nature. The more "environmentalist" teachings were gradually abandoned as the Pythagoreans accommodated themselves to the general attitudes of Greco-Roman culture. For instance, the objections to animal sacrifice, and to most plants as food, were dropped. The divorce of body and soul in later Pythagorean thought, wherever its influence was strong, brought with it indifference not only to the body, but to all the rest of the natural environment. Hughes is in the department of history, University of Denver, Denver, CO. (EE)

Hughes, J. Donald, Pan's Travail: Environmental Problems of the Ancient Greeks and Romans. Baltimore: The Johns Hopkins University Press, 1994. \$ 39.95 hardcover. Many think an environmental crisis is a modern crisis. But an examination of the evidence shows that the Greeks and Romans not only suffered from some of the same predicaments that plague us, but in many cases they were aware of them and commented on them. Deforestation, overgrazing, erosion, depletion of wildlife and natural resources, pollution, urban problems such as water supply and sewage disposal. Hughes teaches environmental history at the University of Denver. (v5,#2)

Hughes, J. Donald, "Ecology and Development as Narrative Themes of World History," Environmental History Review 19 (1995): 1-16. The story line, or organizing principle, of virtually everything that aspires to be world history in recent times is "development," as revealed by a survey of textbooks, but this is an inadequate principle. The new narrative of world history must have ecological process as its major theme. It must keep human events within the context where they really happen, and that is the ecosystem of the Earth. Hughes teaches history at the University of Denver. (v6,#2)

Hull, Carrie L. "When Something is to be Done: Proof of Environmental Harm and the Philosophical Tradition." Environmental Values 8(1999):3-25. ABSTRACT: This paper is centred around a debate taking place among environmental scientists. One camp argues that proof of a causal connection between a chemical and a biological anomaly must be demonstrated in the laboratory. The other contends that actual damage is underestimated in the lab, and that it is therefore necessary to conduct supplemental ecoepidemiological research in order to determine the full impact of toxic chemicals. Members of the former contingent - claiming to be defending scientific rigour - sometimes accuse their peers of practising an inferior science. This paper argues that this contention is supported by a philosophical tradition tending to favour abstract and formal analysis over the close examination of material detail. To the extent that this preference has been adopted by the media, industry, policy analysts, and regulatory bodies, more is at stake than an intellectual squabble. The paper provides a brief overview of the history of the formalist tendency in philosophy, followed by an illustration of the ways in which advocates of a strict laboratory methodology implicitly rely on this foundation. The work and ideas of contemporary ecoepidemiologists are then compared to this imposing edifice of traditional science. KEYWORDS: Philosophy of science, epidemiology, environment, pollution, mathematics. Carrie L. "Understandings of Environmental Quality: Ambiguities and Values Held by Environmental Professionals," Environmental Management 31(no. 1, 2003):1-13. Analysis of the values held by environmental professionals, revealing many kinds of values, and some ambiguity about them. Definition and management of environmental quality, biocentric, ecocentric, utilitarian, aesthetic, and spiritual values. The authors are quite familiar with and often cite environmental philosophers. This was a research project of the USDA Forest Service North Central Experiment Station. Well worth reading for

philosophers. The authors are in the College of Natural Resources, Virginia Polytechnic Institute and State University, Blacksburg.

Hull, R.B. *Infinite Nature*. Chicago: University of Chicago Press, 2006. Much of the failure to make significant progress in environmental protection in recent years can be attributed to the fundamentalism of environmental activists who each see nature from one particular perspective and deny the validity of all other points of view. But there is no single nature. Rather, there is a multiplicity of natures, an infinite number of them depending on how each of us views the world (Thoreau, Jefferson, Muir, Pinchot, Leopold, Native Americans, Jared Diamond, and on and on). We ought to embrace this plurality of ways in which nature can be “constructed.” A pragmatic pluralism will dissolve the polarization between the different factions of fundamentalist environmentalists. Within this pluralism a general theme is that humans should not be seen as separate from nature. We part of nature even when we attempt to dominate it.

Hull, Robert, "All about Eve: A Report on Environmental Virtue Ethics," Ethics and the Environment 10(no. 1, 2005):89-110. I examine and assess an important developing trend in environmental ethics, environmental virtue ethics. I begin by providing a thorough survey of influential and representative contributions to environmental virtue ethics. Along with explaining these contributions to environmental virtue ethics I discuss their various strengths and weaknesses. In the second section I explain what I believe an environmental virtue ethic needs to do to complement other perspectives in environmental ethics. Then, using the best aspects of previously published work along with some additional argument and analysis, I provide a concise portrait of an environmental virtue ethic that combines the advantages of Aristotelian virtue theory with the insights of contemporary environmental ethics. The environmental virtue ethic that emerges from this analysis and discussion is primarily a philosophical praxis. It provides a model of living well in which an understanding of and a concern for the environment human is constitutive of human flourishing. As a praxis this environmental virtue ethic articulates an account of human flourishing with a view to suggesting how a person can improve her own life by working to preserve wild nature. Hull is in philosophy, West Virginia Wesleyan College. (Eth&Env)

Hulme, Mike. “The Conquering of Climate: Discourses of Fear and Their Dissolution.” *The Geographical Journal* Vol. 174, no. 1 (2008): 5-16. Much of the public discourse of global climate change includes fear-like words such as “catastrophe” and “collapse.” To help make sense of this language, Hulme discusses several earlier European discourses of fear associated with climate to glean ways in which these discourses form and dissolve within a specific cultural matrix. Today’s cultural matrix includes conventional, utopian, and brash attempts to conquer climate change by relying upon ideas of mastering, controlling, and engineering future climate.

Hulse, David, and Ribe, Robert, "Land Conversion and the Production of Wealth," Ecological Applications 10(no. 3, 2000):679-682. Values associated with land conservation and development are typically couched in seemingly scientific terms, often those of ecology, but such value judgments are more normative than appears in the quasi-scientific vocabulary. Providing the theoretical and empirical basis for appropriate marginal evaluations of ecological worth may require considerable advances in ecological science and in environmental philosophy. The authors are in landscape architecture and sustainable development, University of Oregon, Eugene.

Humphrey, Mathew I. "Deep Ecology and the Irrelevance of Morality: A Response." Environmental Ethics 21(1999):75-79. In his article "Deep Ecology and the Irrelevance of Morality," Eric H. Reitan contends that, contrary to the disavowals of Fox and Naess, the "ecosophy T" concept of "Self-realization" constitutes a precondition of morality according to a "robust" Kantian moral framework. I suggest that there is a significant problem involved in rendering Self-realization compatible with a Kantian moral framework. This problem of ontological priority demonstrates that Naess and Fox are in fact correct in their assertion that Self-realization is a nonmoral phenomenon. (EE)

Humphrey, Mathew, Preservation Versus the People. Oxford: Oxford University Press, 2002. Why should any society decide to devote scarce resources, as a matter of public policy, to preserving natural objects? "Much of the work in contemporary ecological political philosophy 'frames' the problem of preservation in such a way that leads ecological political philosophers to become divisive and conflictual. I will suggest that ecological political philosophers need to move away from framing the problems they address in terms of ecocentrism and anthropocentrism ... and should instead accept the ineliminable contingency of political argument" (pp. 1-2).

Thinking in environmental ethics has been dominated by the "ecocentric / anthropocentric" distinction. Answers focus on either "intrinsic values in nature" or on the human welfare benefits that will accrue from preservationist policies. These two answers are generally taken to be mutually

exclusive. Ecocentrists think to transcend anthropocentrism. The ecological humanists think the ecocentrists are guilty of misanthropy. Humphrey proposes a "conceptual morphology" of "ecocentrism, social ecology, and eco-Marxism" and "this opens the way for a new substantive position with respect to the ecocentric/humanist axis in environmental ethics" (p. 8). "What I have tried to show is that there are a rich array of arguments from human interest embedded in ecocentric discourse, and also to show that arguments independent of human interest can be made from the humanist side of the ontological divide" (pp. 194-195). Humphrey is in philosophy, University of Nottingham, UK.

Humphrey, Matthew, Preservation versus the People? Nature, Humanity, and Political Philosophy. Oxford: Oxford University Press, 2002. Humphrey sets forth the best human-interest position he can find to support preservation. Humphrey questions the dichotomy between ecocentric and anthropocentric positions. Just about all ecocentric claims do in fact require including some human interests, if only the long term human interests in a healthy and congenial biosphere, or some deep ecology self-realisation, or simply the realisation that humans alone are in a position to appreciate intrinsic value. He puts forth a core principle of the "strong irreplaceability" for environmental ethics to be concerned with nature preservation. This principle emphasises the value of the authenticity of particular natural environments to specific groups of humans, so it is "clearly an argument based on human interests" (p.191. Human interests are deeply embedded in ecological integrity. Reviewed by John S. Dryzek, Environmental Values 13(2004):125-126. (EV)

Humphrey, Peter, "The Ethics of Earthworks," Environmental Ethics 7(1985):5-21. Humphrey criticizes the creation of artistic "earthworks" such as "Running Fence" by Christo from the perspective of environmental ethics. If nature has intrinsic value, the earthwork cannot improve this value; it creates a new object with a different value. If, on the other hand, earthworks are instrumentally valuable, it is doubtful that their benefits outweigh the costs. (Katz, Bibl # 1)

Humphrey, Peter. "The Ethics of Earthworks." Environmental Ethics 7(1985):5-21. Use of the environment for industrial purposes has long been the object of moral criticism. What about use of the environment for the purpose of making art? Is this, too, subject to ethical questioning? I show that earthworks, even though they are artworks, are not free from such criticism. I then examine defenses of them which either have been offered by earthworks artists or are plausible claims. Problems with these defenses show that earthworks are at least not obviously ethical. Hunt, W. Murray. "Are Mere Things Morally Considerable?" Environmental Ethics 2(1980):59-65. Kenneth Goodpaster has criticized ethicists like Feinberg and Frankena for too narrowly circumscribing the range of moral considerability, urging instead that "nothing short of the condition of being alive" is a satisfactory criterion. Goodpaster overlooks at least one crucial objection: that his own "condition of being alive" may also be too narrow a criterion of moral considerability, since "being in existence" is at least as plausible and nonarbitrary a criterion as is Goodpaster's. I show that each of the arguments that Goodpaster musters in support of his criterion can be used equally well to bolster "being in existence" as a test of moral considerability. Moreover, I argue that "being in existence" appears to be a stronger criterion overall, since it is broader. Until or unless a fuller justification is forthcoming of "being alive" as a satisfactory criterion of moral considerability--a justification which must demonstrate that "mere

things," included under the condition of "being in existence," do not deserve moral consideration-- Goodpaster's thesis is confronted with a serious problem. Hunt is in the department of Philosophy and Religion, Susquehanna University, Selinsgrove, PA. (EE)

Hunter, James, On the Other Side of Sorrow: Nature and People in the Scottish Highlands. Edinburgh: Mainstream Publishing Co., 1995. £ 17.50. U.S. Distributor: Trafalgar Square Publishers, Howe Hill Road, North Pomfret, VT 05053. 802/457 1911. The Scottish Highlands were, in earlier centuries, depopulated in heartbreak with the enforced removal of its peoples. Today conserving the Highlands environment is, quite rightly, a matter of high public priority, but environmentalists must take account of the sensibilities of those who see a deserted Highland glen not so much as a piece of wilderness as a place where everyone who ever mattered is dead and gone. Environmentalists need to be aware of Highland attitudes to the Highlands, all the more so in view of the fact that the Gaelic-speaking people who inhabited the area for 1500 years held so positive a view of nature.

The Highlands suffer from deforestation and forms of land use that prevent the regeneration of the land. The task of preserving the Highlands is not one of preserving what is presently there, but of putting right the many thing which, over several centuries, have gone so desperately wrong. Further, the area now has one of Europe's fastest growing rural populations. The rehabilitation of the Highlands needs simultaneously to bring about the restoration of people to some at least of the many localities where human communities, and the Gaelic culture association with those communities, were so long ago destroyed. Hunter is a freelance historian, writer, and broadcaster who lives in the Skye crofting township of Borve. (v7,#1)

Hunter, Jr., Malcolm, Robert K. Hitchcock, and Barbara Wyckoff-Baird, "Women and Wildlife in Southern Africa," Conservation Biology 4(1990):448-451. A long tradition of local hunting of game animals was broken when centralized governments usurped control over hunting as a source of international tourist revenue. Local communities no longer have a vested interest in sustainable utilization and make little effort to control the deprivations of poachers. Even where efforts have been made to restore the local benefits of hunting--village-based use of large mammals for meat, skins, and other products, marketed for cash income--these are undertaken by village men. Women are ignored, continuing the traditional division of labor. But it is crucial that women be included in such project designs, if there is to be both improved human welfare and conservation of a sustainable wildlife resource. Hunter is in wildlife, University of Maine; Hitchcock is an anthropologist at the University of Nebraska; Wyckoff-Baird is with Development Alternatives, Washington, DC.

Hunter, Malcom L., Jr., "Natural Fire Regimes as Spatial Models for Managing Boreal Forests," Biological Conservation 65(1993):115-120. Conservationists often think that humans, in harvesting a resource, ought to mimic natural regimes, and therefore imitate nature as much as possible. But in boreal forest ecosystems in Canada, which were shaped by crown fires that destroyed and replaced large areas, this would mean timber harvesting, mimicking fires, in quite large clearcuts that environmentalists are reluctant to advocate. Perhaps moderate sized clearcuts clustered into portions of land areas bounded by water bodies is a solution. Hunter is in forest resources, University of Maine. (v5,#4)

Hurnik, J.F., "Ethics and Animal Agriculture", Journal of Agricultural and Environmental Ethics 6(1993). In the past, value judgments regarding animal agriculture, its techniques and goals, focused predominantly on production efficiency. At the present time, the concept of maximized production is gradually losing ground to a broader concept of optimal production. Decreasing consumer trust in some animal products, the impact of modern agriculture on the environment, increasing disparities in food production around the globe, loss of family farms, declining self-respect of farmers due to increasing dependence on subsidies, and the decreasing social reputation of farmers due to economic pressures to intensify even at the cost of animal quality of life, should be incorporated in any ethically relevant assessment of modern animal production systems. In its main section, the paper focuses on the quality of life of animals used for food production. It proposes an instrumental definition of animal well-being by emphasizing harmony between the organism and its surroundings; harmony based on an acceptance of basic moral principal that every sentient, living organism subjected to full, direct human control, should have an opportunity to experience an environment for which its own genotype is predisposed, in order to develop into a physically and psychologically healthy organism. In the context of the search for welfare-positive environments and management systems for food animals, the paper discusses the important distinction between animal needs and desires and proposes that it is safer to consider that animal quality of life is regarded rather as a function of satisfaction of animal needs than satisfaction of animal desires. In its final part, the paper proposes longevity studies to indirectly assess the quality of life in various production systems. Hurnik is in the Department of Animal and Poultry Science, University of Guelph, Guelph, ONT, Canada N1G 2W1.

Hurnik, J.F. & Lehman, Hugh, "Ethics and Farm Animal Welfare", Journal of Agricultural Ethics 1(1988):305-318. The authors argue that ethical considerations are relevant for evaluating animal production systems and that in consequence agrologists should seriously consider the arguments of animal welfare supporters. Furthermore, the authors point out the ethical basis for some (though not all) of the conclusions proposed by supporters of animal welfare. Hurnik is in animal and poultry science and Lehman is in philosophy at the University of Guelph, Ontario.

(v.11,#4)

Hursthouse, Rosalind, On Virtue Ethics. Oxford: Oxford University Press, 1999. With a section on "Evaluating Plants and Animals" (pp. 197-204). We evaluate plants and animals on how well they do what they are capable of doing in their forms of life, with more advanced capacities in animals than in plants, and more advanced capacities in some animals than others. "The truth of such evaluations of living things does not depend on any way on my wants, interests, or values, nor indeed on 'ours'. They are, in the most straightforward sense of the term, 'objective'; indeed, given that botany, zoology, ethology, etc., are sciences, they are scientific." When we evaluate such organisms, it is a mistake "to think that they necessarily have something to do with approval or praise" (pp. 202-203).

"The overall summing up evaluation--that this x is a good specimen of its kind--identifies it as an x that is as ordinarily well fitted or endowed as an x can be to do or live well, to thrive or flourish (in a characteristically x way). What living things do is live; quite generally, a good living thing lives well--unless prevented by something outside itself" (p. 205). Hursthouse is in philosophy at the Open University, UK.

Hurtado, L. W., "Enchanted, Created, or Cosmic Accident? 'Nature' and Being Human in the 20th Century," Crux 19(June 1993):18-27. Crux is a journal published by Regent College, Vancouver, BC. An enchanted world, a created world, or a random world--any of these views can be seen as demanding or justifying a positive ecological ethic. Ill-informed accounts by each of the others is not helpful. The biblical view of the world and the role of the human species in it has received a disproportionate share of such vilification in the recent environmental debate. Hurtado argues for corrections to widely circulated but misleading understandings of the monotheist position. Hurtado teaches New Testament at New College, University of Edinburgh. (v.8,#4)

Draws on the tradition of monks and nuns living in a forest monastery, with an art of searching for deeper meanings in nature and respect for life. Hutanuwatr is a former Buddhist monk. (v.10,#2)

Hutchings, JA; Reynolds, JD, "Marine Fish Population Collapses: Consequences for Recovery and Extinction Risk", BioScience 54 (no.4, 2004): 297-309(13). Rapid declines threaten the persistence of many marine fish. Data from more than 230 populations reveal a median reduction of 83 in breeding population size from known historic levels. Few populations recover rapidly; most exhibit little or no change in abundance up to 15 years after a collapse. Reductions in fishing pressure, although clearly necessary for population recovery, are often insufficient. Persistence and recovery are also influenced by life history, habitat alteration, changes to species assemblages, genetic responses to exploitation, and

reductions in population growth attributable to the Allee effect, also known as depensation. Heightened extinction risks were highlighted recently when a Canadian population of Atlantic cod (Gadus morhua) was listed as endangered, on the basis of declines as high as 99.9 over 30 years. Unprecedented reductions in abundance and surprisingly low rates of recovery draw attention to scientists limited understanding of how fish behavior, habitat, ecology, and evolution affect population growth at low abundance. Failure to prevent population collapses, and to take the conservation biology of marine fishes seriously, will ensure that many severely depleted species remain ecological and numerical shadows in the ecosystems that they once dominated.

Huxham, Mark and David Sumner. "Emotion, Science and Rationality: The Case of the Brent Spar." Environmental Values 8(1999):349-368. ABSTRACT: In June 1995, a campaign by Greenpeace forced the multinational oil company Shell to cancel its planned disposal of a redundant oil installation in the Atlantic. The Brent Spar incident attracted massive publicity and was influential in changing government policy on marine disposal of waste. During and following their campaign, Greenpeace were criticised as emotive and irrational by Shell and academic scientists. This paper looks at the arguments used during the debate, using literature, interviews and questionnaires. We investigate the use of key environmental words and phrases and ask what is meant by rationality in this context. We discuss some of the lessons that should be learnt from the incident by policy makers and scientists. KEYWORDS: Brent Spar, rationality, science, precaution, sustainability. Iles, Alastair, "Learning in Sustainable Agriculture: Food Miles and Missing Objects," Environmental Values 14(2005):163-183. Industrial production imposes geographical, economic and cultural distances between producers and consumers. The concept of constituting 'missing objects' can help shrink these distances by enabling actors to engage in discourses and practices about contexts beyond what is materially present. Since the mid-1990s, food miles have emerged as an example of missing objects, representing the distance that agricultural products travel from the farm to the dining table, and the environmental effects of transportation. I analyse how consumers, farmers, activists, industry and policy-makers in the United States and Europe are building agency in making and using food miles. Iles is in the Energy and Resources Group, University of California at Berkeley, Berkeley, CA. (EV)

Imhoff, Marc L., et al., "Global Patterns in Human Consumption of Net Primary Production," Nature 429, No. 6994, 2004, pp. 870-873. The uneven footprint of human consumption. "Many regions are already consuming far beyond what their local area could possibly produce. These areas are being subsidized by imports from other parts of the world; they are literally on life support." (Taylor Ricketts). Humans represent about half of one percent of biomass on Earth and appropriate about 20% of this biomass annually. Western Europe and South Central Asia consume more than 70 percent of what their regions produce, while in South America just 6 percent is consumed. (v. 15, # 3)

Ims, Rolf A.; Fuglei, Eva, "Trophic Interaction Cycles in Tundra Ecosystems and the Impact of Climate Change," BioScience 55(no.4, April 2005):311-322(12). While population cycles are geographically widespread, it is on arctic tundra that such cycles appear to be most influential for the functioning of the whole ecosystem. We give an overview of tundra species that exhibit population cycles and describe what are currently believed to be the causal mechanisms. Population cycles most likely originate from trophic interactions within the plant-based tundra food web, where lemmings, either as prey for carnivores or as consumers of plants, play the key role. The predominance of trophic interaction cycles at northern latitudes is ultimately related to climate, and such cycles should therefore be vulnerable to climate change. Recent evidence indicates that changes have already taken place in the dynamics of some key herbivores and their predators, consistent with the expected impacts of climate change. There is a strong need for large-scale integrated monitoring and research efforts to further document such changes and their ecosystem consequences.

Inamdar, Amar, et al., "Capitalizing on Nature: Protected Area Management," Science 283(19 March 1999):1856-1860. The financial difficulties of government agencies responsibly for biodiversity in the developing world. They hold large land assets, perhaps 5% of the total area of a country, expensive to maintain, generating most of their revenue through tourism. But they are "socially exclusive," since locals cannot exploit these resources, and this is receiving growing criticism from an increasingly democratized populace (and an increasing population) at home. Responses often involve community based conservation. But these activities are also expensive, their conservation benefits are ambiguous, and they have little prospect of generating income to cover their costs.

Kenya has 10% of its land in protected areas, generating about \$ 42 million in tourist revenues. This same land, converted to agriculture and livestock, could support 4.2 million people, generating \$ 203 million. Protected areas are almost universally unpopular with local peoples, and international observers tend to sympathize. Protected areas are suffering from a public relations crisis. On the one hand, simply fencing in protected areas is an untenable strategy. On the other hand, difficult tradeoffs between conservation and development will have to be made. The four authors are in the Environment and Development Group, Oxford, UK. (v.10,#1)

Independent Commission on Population and Quality of Life. Caring for the Future: Making the Next Decades Provide a Life Worth Living. New York: Oxford University Press, 1996. 384 pp. \$14.95 paper. Examines the challenges that face all countries, both rich and poor, in the last years of the century. Goals to confront these crises. The report places women at the center of development, and caring at the center of public policy, arguing that there must be a new focus on sustainable quality of life in order to slow population growth and reduce human impact on the environment. Oxford, UK: Berg, 1996. "What I wish to suggest is that we reverse this order of [Western] primacy and follow the lead of hunter-gatherers in taking the human condition to be that of a being immersed from the start, like other creatures, in an active, practical and perceptual engagement with constituents of the dwelt-in world. This ontology of dwelling, I content provides us with a better way of coming to grips with the nature of human existence than the alternative, Western ontology whose point of departure is that of a mind detached from the world and which has literally to formulate it--to build an intentional world in consciousness--prior to engagement. The contrast, I repeat, is not between alternative views of the world; it is rather between two ways of apprehending it, only one of which (the Western) may be characterized as the construction of a view, that is, as a process of mental representation. As for the other, apprehending the world is not a matter of construction but of engagement, not of building but of dwelling, not of making a view of the world but of taking a view in it" (pp. 120-121). Interpretation: A Journal of Bible and Theology, vol. 50, no. 1 (January 1996), is a thematic issue on Theology and Ecology. Among the contributors are:

James A. Nash, "Toward the Ecological Reformation of Christianity" (pp. 5-15). Christian theology and ethics are largely inadequate to confront the ecological crisis of today. They are in need of reformation. At the center of Christian faith, we shall not find a mandate to pollute, plunder, and prey on the rest of nature. Instead, we shall discover that the core affirmations endow all life with a moral significance that entails human responsibility toward the whole of nature.

Holmes Rolston, III, "The Bible and Ecology" (pp. 16-26). The Bible is not a book of science, and therefore not of ecology. It does, however, sketch a vision of human ecology, and contemporary readers encounter claims about how to value nature. The Bible's vision is simultaneously biocentric, anthropocentric, and theocentric. The Hebrews discovered who they were as they discovered where they were, and their scriptures can be a catalyst in our ecological crisis.

W. Sibley Towner, "The Future of Nature" (pp. 27-35). Bible and biology agree: Human beings cast the biggest shadow over the future of nature. At the end of the millennium we face a choice: We can continue to overuse and exploit our ecosphere or we can exercise tender "dominion" in the world, as God's agents here.

Theodore Hiebert, "Re-Imaging Nature: Shifts in Biblical Interpretation" (pp. 36-46). Nature, and the place of humans within it, has again become a topic of much discussion. The tendency of biblical scholars has been to describe the human being in terms that set it apart from nature. More recently, ecological concerns have impelled biblical scholars to rethink their position. This has caused them to reevaluate the nature of humanity and to construe the human being not as standing above or at the center of nature, but as being part of nature. (v6,#4)

Ip, Po-Keung. "Taoism and the Foundations of Environmental Ethics." Environmental Ethics 5(1983):335-43. I show how the Taoist philosophy, as exemplified by both Lao Tzu and Chung Tzu, is capable of providing a metaphysical foundation for environmental ethics. The Taoist concept of nature, the notions of ontological equality and axiological equality of beings, together with the doctrine of Wu Wei can fulfill, at least in a preliminary way, our purpose. The notion of a minimally coherent ethics is introduced and is shown to be pertinent to the construction of an ethics which bears a close relationship to science. Ip is in the department of philosophy, University of Western Ontario, London, Ontario, Canada. (China)

Ip, Po-Keung, "Taoism and the Foundations of Environmental Ethics," Environmental Ethics 5(1983):335-343. Both the Taoist concern for all beings and the principle of "nonaction" are offered as the basis of an environmental ethic. But the problem for any Eastern metaphysic is its acceptance in the West. Ivakhiv, Adrian. "Toward a Multicultural Ecology", Organization and Environment, 15, (No. 4, 2002): 389-409. The debate between realists and constructivists has polarized environmental scholarship in recent years. Ivakhiv situates this debate within the longstanding modernist tradition of categorically distinguishing "nature" from "culture", and the natural sciences from the social sciences and humanities, and suggests that we need to find a non-dualistic space for rethinking cultural-ecological relations. Such a space has been articulated by actor-network theory, but this theory leaves significant gaps in its understanding of agency and of macro forces. To fill in these gaps, the author draws on perspectives that theorize perception and agency as embodied, animate, and ecologically embedded and that theorize macro forces as discursively shaped and amid causally multidirectional and multiscalar. The author proposes the concept of multicultural ecology as a way of articulating the indivisibility of nature and culture and the multiplicity of cultural-ecological practices, and suggests a normative dimension by which such practices can be compared and evaluated. Ivakhiv is an assistant professor in the Department of Religious Studies

and Anthropology and the Program in Environmental Studies at the University of Wisconsin, Oshkosh.

Ivancic, A., Turk, J., Rozman, C., and Sisko, M., "Agriculture in the Slovenian transitional economy: The preservation of genetic diversity of plants and ethical consequences," Journal of Agricultural and Environmental Ethics 16(2003):337-365. Slovene agriculture is going through drastic changes. Most of the land is still owned by small farmers. The production is oriented to the market and is based on modern Western technology. It is associated with increasing pollution and is becoming a serious threat to biodiversity. Many of the wild plants are endangered due to genetic erosion within species. The traditional crops and varieties are being replaced by imported materials and the use of chemicals has been increasing. Many of the traditional varieties have been neglected and/or lost. The legislation is not efficient enough to protect the environment and biotic diversity. KEY WORDS: biodiversity of plants, ethical issues, Slovene agriculture, transitional economy. (JAEE)

Ives, Christopher, "Nature Wild and Stylized: Gary Snyder and the Japanese Love and Destruction of Shizen (Nature)." Paper given at American Academy of Religion, San Francisco, November 21-24. The Japanese are often said to love nature, but Japan has a dismal environmental record. One reason why the Japanese love of nature has produced such poor stewardship is that the nature loved by most Japanese has been nature simplified or reduced to what they regard as expressing its essence. This is stylized, not wild nature. Many of the remaining natural areas in Japan have been shaped and manipulated away from their wild state. Gary Snyder, though influenced by the Japanese, does not really appropriate the Japanese stylized nature but his orientation is primarily toward wild nature. Nevertheless Japanese ideas were useful to him and can be useful to others. Ives is in the Department of Religion, University of Puget Sound, Tacoma, WA 98416. Copies available from him. (v3,#4)

Jackson, Dana L., and Jackson, Laura L., eds., The Farm as Natural Habitat: Reconnecting Food Systems with Ecosystems. Washington, DC: Island Press, 2002. Modern farming is a booming success and simultaneously a crisis. Currently, the move toward industrialized agriculture is creating "ecological sacrifice zones." We make food on farms, and when we want nature we drive somewhere else to find it. We ought to ask if we can use farmland better, and make the farm a quality environment. The U.S. and other countries have a long history of government regulation to preserve other desired values on

farmlands (such as a fair wage, or limiting toxic pollutants); farmland policy can also be restructured to promote ecological values, with benefits to farmers and to the nation. This often works best and most easily, the authors concede, with lands that are not ideal for farming (hilly, semi-arid, poor soil); it is tougher with prime agricultural land.

Jackson, Tim, "Sustainability and the 'Struggle for Existence': The Critical Role of Metaphor in Society's Metabolism," Environmental Values 12(2003): 289-316. This paper presents a historical examination of the influence of the Darwinian metaphor 'the struggle for existence' on a variety of scientific theories which inform our current understanding of the prospects for sustainable development. The first part of the paper traces the use of the metaphor of struggle through two distinct avenues of thought relevant to the search for sustainable development. One of these avenues leads to the biophysical critique of conventional development popularised by 'ecological economists' such as Georgescu-Roegen and Daly. This critique suggests that modern economic systems have gone astray by failing to respect the biological and physical limits to development and that they should be adapted to make them more like ecological systems. The other avenue leads to the modern insights of evolutionary psychology. These latter insights suggest that in certain key respects, the economic system (and actors within it) are already behaving more or less like an ecological system, driven as they are by evolutionary imperatives. Consequently, this second avenue appears to offer far bleaker prospects for achieving sustainable development than the first. However, the final part of the paper re-examines the historical roots of the metaphor itself, and suggests a number of ways in which a critical response to those historical roots might influence our understanding of the prospects for sustainable development.

Jacobs, Harvey L., and Annie L. Booth. "Ties that Bind: Native American Beliefs as a Foundation for Environmental Consciousness." Environmental Ethics 12(1990):27-43. In this article we examine the specific contributions Native American thought can make to the ongoing search for a Western ecological consciousness. We begin with a review of the influence of Native American beliefs on the different branches of the modern environmental movement and some initial comparisons of Western and Native American ways of seeing. We then review Native American thought on the natural world, highlighting beliefs in the need for reciprocity and balance, the world as a living being, and relationships with animals. We conclude that Native American ideas are important, can prove inspirational in the search for a modern environmental consciousness, and affirm the arguments of both deep ecologists and ecofeminists. Jacobs, Michael. "Sustainable Development, Capital Substitution and Economic Humility: A Response to Beckerman." Environmental Values 4(1995):57-68. Wilfred Beckerman [1] accepts two of the premises of the environmentalist argument: that long-term environmental impacts may have serious effects on future generations, and that these future generations should be the object of ethical concern. However he rejects the conclusion that is widely claimed to follow: namely that 'sustainability' should be a principal objective of economic policy. For him, the proper (and ultimately the only) objective of economic policy remains optimality, the maximisation of benefits over costs --even when environmental concerns are taken into account. His argument has five elements: a redefinition, a positive proposition, two negative ones, and a very large assumption. I shall take each in turn. Jacobs is in the Centre for Environmental Change, University of Lancaster. (EV)

Jacobsen, Eivind, and Arne Dulsrud, "Will Consumers Save The World? The Framing of Political Consumerism," Journal of Agricultural and Environmental Ethics 20(2007):469-482. An active ethically conscious consumer has been acclaimed as the new hero and hope for an ethically improved capitalism.

Through consumers' "voting" at the checkout, corporations are supposed to be held accountable for their conduct. In the literature on political consumerism, this has mainly been approached as political participation and governance. In this article, we do a critical review of this literature. We do so by questioning the existence of what we call a "generic active consumer model." At the core of this position, there is a belief that the active consumer is a universal entity, available across nations and time. Instead we call for an approach that takes accord of the ways consumers and consumer roles are framed in interactive processes in markets, governance structures, and everyday life. Consumers in different countries assess their responsibilities and their powers *as consumers* differently due to different institutionalizations within distinctive contexts. We also must take into account how the inertia of ordinary consumption and the moral complexities of everyday life restrict the adoption of an active consumerist role. Hence, the debate on political consumerism should make for a more realistic notion of ethical consumer-sovereignty and its role in improving the workings of capitalism. In our view, these findings have severe implications for understanding both theories of political consumption and the dynamics of political consumption per se. Keywords: consumer sovereignty, ethical shopping, political consumerism.

Jacobsen, Knut A. Review of Christopher Key Chapple and Mary Evelyn Tucker, eds., Hinduism and Ecology: The Intersection of Earth, Sky, and Water. Environmental Ethics 25(2003):333-336. (EE)

Jacobsen Knut A., Prakrti in Samkhya-Yoga: Material Principle, Religious Experience, Ethical Implications. New York: Peter Lang, 1999. This book is the first monographic study of "prakrti" (nature). It traces the history of the word "prakrti," the word chosen by the modern North Indian languages to translate the English word "nature," through the texts of the Hindu, Buddhist, and Jain systems of religious thought. "Prakrti" is one of the central metaphysical principles in the religious traditions of Hinduism, especially in the influential Samkhya and Yoga traditions. The second part of the book gives a systematic analysis of this important principle in the Proto-Samkhya, Samkhya, and Samkhya-Yoga texts. This book investigates a religious experience called "merging with prakrti" ("prakrtilaya"), which has been neglected in previous studies, but is described in the Samkhya and Yoga texts, with implications for issues of interspecies or environmental ethics. Jacobsen is in the Department of the History of Religions, University of Bergen, Norway. Knut.Jacobsen@krr.uib.no. (v.11,#1)

Jacobsen, Knut A., "The Institutionalization of the Ethics of 'Non-Injury' Toward All "Beings in Ancient India." Environmental Ethics 16(1994):287-301. The principle of non-injury toward all living beings (ahimsa) in India was originally a rule restraining human interaction with the natural environment. I compare two discourses on the relationship between humans and the natural environment in ancient India: the discourse of the priestly sacrificial cult and the discourse of the renunciants. In the sacrificial cult, all living beings were conceptualized as food. The renunciants opposed this conception and favored the ethics of non-injury toward all beings (plants, animals, etc.), which meant that no living being should be food for another. The first represented an ethics modeled on the power that the eater has over the eaten while the second attempted to overturn this food chain ethics. The ethics of non-injury ascribed ultimate value to every individual living being. As a critique of the individualistic ethics of non-injury, a holistic ethics was developed that prescribed the unselfish performance of one's duties for the sake of the functioning of the natural system. Vegetarianism became a popular adaptation of the ethics of non-injury. These dramatic changes in ethics in ancient India are suggestive for the possibility of dramatic changes in environmental ethics today.

Jacobsen, Knut A., "Bhagavadgita, Ecosophy T, and Deep Ecology," Inquiry 39(no. 2, June, 1996):219-38. "This article analyzes the influence of Hinduism on Ecosophy T. Arne Naess in several of his environmental writings quotes verse 6.29 of the Bhagavadgita, a Hindu sacred text. The verse is understood to illustrate the close relationship between the ideas of the oneness of all living beings, non-

injury, and self-realization. The article compares the interpretations of the verse of some of the most important Hindu commentators on the Bhagavadgita with the environmentalist interpretation. There is no agreement in the history of the Hindu tradition on the meaning of the verse. The interpretation of Ecosophy T contrasts sharply with the interpretations of the Hindu monastic traditions but has similarities with the twentieth-century social activist interpretations of Mohandas K. Gandhi and S. Radhakrishnan. In Ecosophy T aspects of this social activist version of Hinduism have been creatively reinterpreted in the context of contemporary environmentalism." Of interest is the fact that interpretations of this verse "were originally related to the attempt of the Hindu ascetics to free the self, or atman, from bondage to the material world, an effort which to some degree is the very opposite of that of integrating humans into the natural world the preservation of the biotic communities attempted by contemporary environmental thinkers" (p. 219). Jacobsen teaches at the University of Bergen, Norway. (v8,#3)

Jacques, Peter. *Globalization and the World Ocean*. Walnut Creek, CA: AltiMira Press, 2006. Jacques offers an analysis of the connections between global marine and atmospheric science to global political phenomena. He shows how human survival is intricately linked to the sustainability of the world ocean, a singular connected body of regional oceans that is by definition a global resource that touches all other ecosystems. Jacques warns that the world ocean now offers evidence of several existential crises for global human populations, including declining global fisheries, coral reef losses, and climate change, but there has been a lack of global or regional cooperation in sustaining this complex ecosystem. He suggests how we can synthesize and coordinate global ecological information, exploring three regional areas in their local and global context: the South Pacific, Caribbean basin, and Southeast Asia.

Jaffe, Adam B., Steven R. Peterson, Paul R. Portney, and Robert N. Stavins, "Environmental Regulation and the Competitiveness of US Manufacturing: What Does the Evidence Tell Us?" Journal of Economic Literature 33(March, 1995):132-163. The once-conventional wisdom was "that environmental regulations impose significant costs, slow productivity growth, and thereby hinder the ability of US firms to compete in international markets." But now prominent economists see environmental regulations as "not only benign in their impacts on international competitiveness, but actually as a net positive for driving private firms and the economy as a whole to become more competitive in international markets."

James, Jr., Harvey S., "On finding solutions to ethical problems in agriculture," Journal of Agricultural and Environmental Ethics 16(2003):439-457. A distinction should be made between two types of ethical problems. A Type I ethical problem is one in which there is no consensus as to what is ethical. A Type II ethical problem is one in which there is a consensus as to what is ethical, but incentives exist for individuals to behave unethically. Type I ethical problems are resolved by making, challenging, and reasoning through moral arguments. Type II ethical problems are resolved by changing the institutional environment so that people do not have incentives to behave unethically. Type I solutions, however, will not be effective in solving Type II problems. Examples in agriculture and elsewhere show how distinguishing between Type I and Type II ethical problems will help in the identification of solutions to ethical issues in agriculture.

James, Simon P., "Buddhism and the Ethics of Species Conservation," *Environmental Values* 15(2006): 85-97. Efforts to conserve endangered species of animal are, in some important respects, at odds with Buddhist ethics. On the one hand, being abstract entities, species cannot suffer, and so cannot be proper objects of compassion or similar moral virtues. On the other, Buddhist commitments to equanimity tend to militate against the idea that the individual members of endangered species have greater value than those of less-threatened ones. This paper suggests that the contribution of Buddhism to the issue of species conservation should not, however, be discounted. It argues, on the contrary, that Buddhist traditions, in reminding us of the moral significance of the suffering of individual animals, add an important dimension to debates concerning the ethical justification of efforts to conserve endangered species. (EV)

James, Simon P. "Human Virtues and Natural Values." *Environmental Ethics* 28(2006):339-353. In several works, Holmes Rolston, III has argued that a satisfactory environmental ethic cannot be built on a virtue ethical foundation. His first argument amounts to the charge that because virtue ethics is by nature "self-centered" or egoistic, it is also inherently "human-centered" and hence ill suited to treating environmental matters. According to his second argument, virtue ethics is perniciously human-centered since it "locates" the value of a thing, not in the thing itself, but in the agent who is "ennobled" by valuing it. These charges, though illuminating, are not in the final analysis compelling. The first misconceives the role of motivation in virtue ethics, while the second ultimately rests on a misunderstanding of the place of the human perspective in ethical considerations. (EE)

James Simon P., "Against Holism: Rethinking Buddhist Environmental Ethics," *Environmental Values* 16(2007): 447-461. Environmental thinkers sympathetic to Buddhism sometimes reason as follows: (1) A holistic view of the world, according to which humans are regarded as being 'one' with nature, will necessarily engender environmental concern; (2) the Buddhist teaching of 'emptiness' represents such a view; therefore (3) Buddhism is an environmentally-friendly religion. In this paper, I argue that the first premise of this argument is false (a holistic view of the world can be reconciled with a markedly eco-unfriendly attitude) as is the second (in speaking of emptiness, Buddhist thinkers are not proposing an 'ecological' conception of the world). Yet the conclusion is, I suggest, true: Buddhism is in certain respects environmentally-friendly, not for the reasons cited above, but because of the view, encapsulated in its teachings and practices, that certain dispositions to treat the natural environment well are an integral part of human well-being. James is in philosophy, Durham University, Durham, UK.

Coombes, eds., Applied Ethics: A Reader (Oxford: Blackwell, 1993). Though there are scientific issues involved, the global warming problem is not primarily a scientific problem. It is an ethical and political problem concerning values. The "policy management" approach derives from neo-classical economic theory and so dominates current public discussion that its assumptions and biases are hardly visible. But this approach can hardly succeed on its own terms because its analytic techniques are inadequate to the complexities of anthropogenic climatic change. Jamieson asks about what changes will be needed if humans and other animals are to survive current threats to the global environment. Jamieson is in philosophy at the University of Colorado, Boulder. Jamieson, Dale, Morality's Progress: Essays on Humans, Other Animals and the Rest of Nature. Oxford: Oxford University Press, 2002. Reviewed by Markku Oksanen, Environmental Values 13(2004):261-263. (EV)

Jamieson, Dale, Morality's Progress: Essays on Humans, Other Animals, and the Rest of Nature. New York: Oxford University Press, 2003. The summation of nearly three decades of work by a leading figure in environmental ethics and bioethics. The twenty-two papers here are invigoratingly diverse, but together tell a unified story about various aspects of the morality of our relationships to animals and to nature. Jamieson's direct and accessible essays will convince sceptics that thinking about these relations offers great intellectual reward, and his work sets a challenging, controversial agenda for the future. With a previously unpublished paper on "Values in Nature." Jamieson is at Carleton College, Northfield, MN.

Jamieson, Dale, "Rights, Justice, and Duties to Provide Assistance: A Critique of Regan's Theory of Rights," Ethics 100(January 1990):349-362. Regan's Case for Animal Rights solves the predation problem by claiming that we humans are required to assist those who are victims of injustice, but we are not required to help those in need who are not victims of injustice. We have no duty to assist the sheep about to be eaten by the wolf, since the wolf is not committing an injustice. But that is an inadequate reply. Consider a case where a human is about to be injured by a boulder rolling down a hill? If the boulder is set in motion deliberately by another human wishing to kill the victim, we are required to assist. But if the boulder is set in motion by an animal inadvertently, we are not required to assist. We are required to help those about to be harmed regardless of whether moral agency is present at the source of harm. But with this Regan's reply about predation fails, and the predation problem is unsolved in the animal rights' view. Jamieson is at the University of Colorado, Boulder. (v2,#4)

Jamieson, Dale, "The Rights of Animals and the Demands of Nature," *Environmental Values* 17(2008):181-199. This paper discusses two central themes of the work of Alan Holland: the relations between the natural and the normative and how our duties regarding animals cohere with our obligations to respect nature. I explicate and defend an anti-speciesist argument that entails strong moral demands on how we should live and what we should eat. I conclude by discussing the implications of anti-speciesism for rewilding and reintroduction programmes.

Jamieson, Dale. "Rational Egoism and Animal Rights." Environmental Ethics 3(1981):167-71. Jan Narveson has suggested that rational egoism might provide a defensible moral perspective that would put animals out of the reach of morality without denying that they are capable of suffering. I argue that rational egoism provides a principled indifference to the fate of animals at high cost: the possibility of principled indifference to the fate of "marginal humans." Jamieson is in the department of philosophy, University of Colorado, Boulder, CO. (EE)

Jamieson, Dale. *Ethics and the Environment: An Introduction*. Cambridge: Cambridge University Press, 2008. Jamieson presents both a sophisticated introduction to environmental ethics and his own positions on a number of issues. He begins by discussing the environment as an ethical question, including technological, economic, religious, and aesthetic considerations. Subsequent chapters focus on topics such as human morality, metaethics, normative ethics (consequentialism, virtue ethics, and Kantianism), animal ethics, biocentrism and ecocentrism, and justice.

Jamieson, Dale. "Ecosystem Health: Some Preventive Medicine." Environmental Values 4(1995):333-344. Some ecologists, philosophers, and policy analysts believe that ecosystem health can be defined in a rigorous way and employed as a management goal in environmental policy. The idea of ecosystem health may have something to recommend it as part of a rhetorical strategy, but I am dubious about its utility as a technical term in environmental policy. I develop several objections to this latest version of scientism in environmental policy, and conclude that our environmental problems fundamentally involve problems in our institutions of governance, our systems of value, and our ways of knowing. These are the problems

that most need to be addressed. KEYWORDS: Desire, ecosystem health, health, objectivity, preference, scientism, subjectivity, values. Jamieson is in the department of philosophy, University of Colorado, Boulder. (EV)

Jamison, Andrew and Erik Baark. "National Shades of Green: Comparing the Swedish and Danish Styles in Ecological Modernisation." Environmental Values 8(1999):199-218. ABSTRACT: Throughout Europe, science and technology policy within the environmental field is currently in a process of transformation, which has been characterised by many observers as ecological modernisation. Emphasis is being given to preventive principles and so-called cleaner technologies in the quest for a more sustainable development. Each European country has, however, adapted the new doctrines and practices in distinctive ways. The main aim of the paper is to show how contemporary policies have been shaped by history, more specifically, by institutional and cognitive traditions, and by national policy styles. By comparing "ecological modernisation" in Sweden and Denmark, we attempt to indicate how such national cultural differences affect the ways in which science and technology policies in the environmental field are formulated and implemented. KEYWORDS: Environmentalism, science policy, ecological modernisation, national styles. Janofsky, Michael, "Judges Overturn Bush Bid to Ease Pollution Rules," *New York Times*. 18 March 2006. <http://www.nytimes.com/2006/03/18/politics/18enviro.html>

A federal appeals court rejected a clean air directive that would allow many power plants, refineries and factories to "avoid installing costly new pollution controls to help offset any increased emissions caused by repairs and replacements of equipment." The court ruled in favor of a coalition of states and environmental advocacy groups.

Janofsky, Michael, "E.P.A. Enforcement Shows Results," New York Times, November 16, 2004, p. A20. The Environmental Protection Agency claims its enforcement regulations will remove one billion pounds

of pollution from air and water in 2004, increased from 600 million pounds the previous year. The Agency sent 265 cases to court last year, a slight increase over the previous year. Environmentalist critics say fewer of the cases come to resolution in the courts, however. (v.14, #4)

Janofsky, Michael, "When Cleaner Air is a Biblical Obligation," New York Times, November 7, 2005. The National Association of Evangelicals, representing 45,000 churches serving 30 million people across the U.S., is circulating among its leaders a draft of a policy statement that encourages lawmakers to pass legislation creating mandatory controls for carbon emissions. A major obstacle to any measure that would address global warming is Senator James M. Inhofe, and Oklahoma Republican who is chair of the Senate Environment and Public Works Committee and an evangelical himself. He has called global warming "the greatest hoax ever perpetrated on the American people." He said the NAE had been "led down a liberal path" by environmentalists.

Janofsky, Michael, "Study Finds Mercury Levels in Fish Exceed U.S. Standards," New York Times, August 4, 2004, p. A15. "More than half the fish in the nation's lakes and reservoirs have levels of mercury that exceed government standards for women of child-bearing age and children, according to an environmental coalition's analysis of a survey by the Environmental Protection Agency." (v. 15, # 3)

Janse van Rensburg, Eureka, Environmental Education and Research in Southern Africa: A Landscape of Shifting Priorities. Ph.D. thesis in the Department of Education, Rhodes University, February 1995. 249 pages. Published copies are available from this department. Research priorities within universities and within the context of political and environmental change in southern Africa. The thesis seeks "a reflexive perspective" that is "outside modernist assumptions" and outlines "research priorities from this perspective. Reflexivity reveals the myths of expert-driven, instrumental and institutionalized research separated from environmental education and based upon rationalistic interpretations of science. It opens up possibilities for transformative knowledge emerging from 're-search' based versions of education as a process of, rather than a means to, social change." Janse van Rensburg is now teaching education at Rhodes University. (v6,#3)

Contributors include Fikret Berkes and Rudolf de Groot. (v6,#1)

Janzen, Daniel, "Gardenification of Wildland Nature and the Human Footprint," Science 279(1998):1312-1313. Wild species can no longer be left "out in the wild," but have to be brought into the human "wildland garden" (if that is not an oxymoron). Humans now have the power to domesticate nature, and their genes urge them to do so. "My genes also know that my inclusive fitness is maximized by supporting those tribal policies that give long-term survival and health to their tribe in the nearby environment. They know that my inclusive fitness is maximized by intensely studying that environment. And my genes' study of the nearby environment says that if we cannot figure out how to hide a package as large as 235,000 wild species in the human genome, my inclusive fitness--my tribe's future--will be severely impacted." (235,000 species is presumably a typical number in a nearby environment.) "The more quickly we can move the remaining large lumps of wild biodiversity into garden status, the greater the chance that they will still be with us in perpetuity." "Gardenification" is a softer word than "management," or "dominion," or "zoo," but the effect is the same. Janzen is well-intended, maybe right. But so much the worse for any species that the human tribe does not find genetically useful in our garden. Janzen is in biology at the University of Pennsylvania and a specialist in tropical ecology. Jasanoff, Sheila, "New Modernities: Reimagining Science, Technology and Development," Environmental Values 11(2002):253-276. "Development" operates as an allegedly value-neutral concept in the policy world. This essay describes four mechanisms that have helped to strip development of its subjective and meaning-laden elements: persistent misreading of technology as simply material and inanimate; uncritical acceptance of models, including economic ones, as adequate representations of complex systems; failure to recognize routine practices as repositories of power; and erasing history and time as relevant factors in producing scenarios for the future. Failure to take these elements into account has led to inequality, injustice and unintended consequences in many development projects. Interpretive analysis of development tools and concepts is a much-needed corrective. (EV)

Jasanoff, Sheila. "The Songlines of Risk." Environmental Values 8(1999):135-152. ABSTRACT: Two decades of social and political analysis have helped to enrich the concept of risk that underlies the bulk of modern environmental regulation. Risk is no longer seen merely as the probability of harm arising from more or less determinable physical, biological or social causes. Instead, it seems more appropriate to view risk as the embodiment of deeply held cultural values and beliefs - the songlines of the paper's title - concerning such issues as agency, causation, and uncertainty. These values are incorporated into the formal methodologies, such as quantitative risk assessment, by which industrial societies assess risk. The meaning of risk accordingly varies from one cultural context to another, posing difficult problems for

global environmental governance. The paper reflects on the role of science in promoting convergent perceptions of risk across disparate political cultures. Jenkins, T. N., "Chinese Traditional Thought and Practice: Lessons for an Ecological Economics Worldview," Ecological Economics 40(2002):39-52. There is a need for a moral dimension regarding nature, which is lacking in the classical Western economic paradigm. The Chinese worldview, derived from Confucian, Taoist, Buddhist and popular religious practice, is based on ideals of harmony, human perfectibility and systemic fit within natural systems. However there are also strong worldly and utilitarian elements at the popular level, and environmental degradation in modern China results from increases in the importance of the pragmatic over the ideal. Chinese traditions offer conceptual resources for ecological thinking by placing economics within a wider socio-ecological fabric, emphasizing soft technologies, challenging meta-economic assumptions, and encouraging systemic wisdom. Jenkins, Willis J. *Ecologies of Grace: Environmental Ethics and Christian Theology*. Oxford: Oxford University Press, 2008. Jenkins develops a map of Christian environmental strategies that draws from traditions of salvation to engage the problems of environmental ethics. He shows how this map can be used to explore the ecological dimensions of Christian theology by discussing the strategies of ecojustice, stewardship, and ecological spirituality that draw on the patterns of sanctification, redemption, and deification and adapt to secular approaches to environmental ethics. Jenkins then examines the problems of these strategies through critical reappraisals of Thomas Aquinas, Karl Barth, and Sergei Bulgakov, each of which can be explored as an ecology of grace. He argues that environmental issues come to the heart of Christian experience and prepare fertile ground for theological renewal.

Jenkins, Willis. "Assessing Metaphors of Agency: Intervention, Perfection, and Care as Models of Environmental Practice." Environmental Ethics 27 (2005):135-154. While environmental ethicists often critique metaphors of nature, they rarely recognize metaphors of environmental practice, and so fail to submit background models of human agency to similar critique. In consequence, descriptions of nature are often shaped by unassessed metaphors of practice, and then made to bear argument for that preferred model. To relieve arguments over "nature" of this vicarious burden, models of agency can and should become a primary topic within the field. In response to some initial misgivings from Eric Katz and taking suggestions from Bryan Norton, Steven Vogel, Holmes Rolston, III, and others, some minimal framing criteria can be developed to promote and facilitate a broad debate over the most appropriate metaphors and models of environmental practice. Jensen, Karsten Klint and Jan Tind Sorensen. "The Idea of 'Ethical Accounting' for a Livestock Farm," Journal of Agricultural and Environmental Ethics 11(1999):85-100. This paper presents the idea of a decision-support system for a livestock farm, called "ethical accounting", to be used as an extension of traditional cost accounting. "Ethical accounting" seeks to make available to the farmer information about how his decisions affect the interests of farm animals, consumers and future generations. Furthermore, "ethical accounting" involves value-based planning. Thus, the farmer should base his choice of production plan on reflections as to his fundamental objectives, and he should make his final decision only after having seriously considered the various consequences for the affected parties.

Jensen, Karsten Klint, "BSE in the UK: Why the Risk Communication Strategy Failed," Journal of Agricultural and Environmental Ethics 17(2004):405-423. The 2000 BSE Inquiry report points out that the most serious failure of the UK Government was one of risk communication. This paper argues that the government's failure to communicate the risks BSE posed to humans to a large degree can be traced back to a lack of transparency in the first risk assessment by the Southwood Working Party. This lack of

transparency ensured that the working party's risk characterization and recommendations were ambiguous and thus hard to interpret. It also meant that uncertainties were not addressed in a satisfactory way. In the recommendations, the attitude to uncertainty was implicit rather than explicit.

The risk communication based on the report amplified these flaws. ... In the concluding section of the paper, this analysis is compared with the food standards agency's (FSA's) approach to BSE. The intervention of this agency was seen as one of the more important efforts to restore consumer confidence in British beef. And the agency certainly appears to be committed to openness and to addressing scientific uncertainty. However, using the risk of BSE in sheep as a case study, the paper shows that transparency - i.e., the clear presentation of factual and normative claims and assumptions underlying advice, and openness about the reasoning based on these claims and assumptions - is less than fully achieved in the FSA's work. Keywords: normative premises, scientific advice, transparency, trust, uncertainty. The author is in the Department of Education, Philosophy and Rhetoric, University of Copenhagen, Denmark. (JAEE)

Jensen, Karsten Klint, "The Moral Foundation of the Precautionary Principle," Journal of Agricultural and Environmental Ethics 15(no. 1, 2002):39-55. The Commission's recent interpretation of the Precautionary Principle is used as starting point for an analysis of the moral foundation of this principle. The Precautionary Principle is shown to have the ethical status of an amendment to a liberal principle to the effect that a state only may restrict a person's actions in order to prevent unacceptable harm to others. The amendment allows for restrictions being justified even in cases where there is no conclusive scientific evidence for the risk of harmful effects.

However, the liberal tradition has serious problems in determining when a risk of harm is unacceptable. Nevertheless, reasonable liberal arguments in favor of precaution can be based on considerations of irreversible harm and general fear of harm. But it is unclear when these considerations can be overridden.

Within the liberal framework, the Commission advocates a so-called proportional version of the Precautionary Principle. This should be clearly distinguished from a welfare-based approach to precaution based on risk-averse weighing up of expected costs and benefits. However, in the last resort, the Commission does seem to make a covert appeal to such considerations. KEY WORDS: harm, liberalism, proportionality, rights, risk,

Jensen, Karsten Klint, "Conflict over Risks in Food Production: A Challenge for Democracy," Journal of Agricultural and Environmental Ethics 19(2006):269-283. When it comes to conflict over risk management priorities in food production, a number of observers, including myself, have called for some sort of public deliberation as a means of resolving the moral disagreements underlying such conflicts. This paper asks how, precisely, such deliberation might be facilitated. It is shown that representative democracy and the liberal regulation that most Western democracies adhere to place important constraints on public deliberation. The challenge is to find forums for public deliberation that can operate within these constraints while still making a constructive contribution. Keywords: food safety - GM crops - public deliberation - risk communication - values. Jensen is in the Danish Centre for Bioethics and Risk Assessment, Royal Veterinary and Agricultural University, Frederiksberg, Denmark. (JAEE)

Jensen, Karsten Klint and Sandøe, Peter, "Food Safety and Ethics: The Interplay Between Science And Values," Journal of Agricultural and Environmental Ethics 15(no. 3, 2002):245-253. The general public in Europe seems to have lost its confidence in food safety. The remedy for this, as proposed by the Commission of the EU, is a scientific rearmament. The question, however, is whether more science will be able to overturn the public distrust. Present experience seems to suggest the contrary, because there is widespread distrust in the science-based governmental control systems. The answer to this problem is the creation of an independent scientific Food Authority. However, we argue that independent scientific

advice alone is unlikely to re-establish public confidence. It is much more important to make the scientific advice transparent, i.e., to state explicitly the factual and normative premises on which it is based. Risk assessments are based on a rather narrow, but well-defined notion of risk. However, the public is concerned with a broader value context that comprises both benefits and risks. Transparency and understanding of the public's perception of food risks is a necessary first step in establishing the urgently required public dialogue about the complex value questions involved in food production. KEY WORDS: risk assessment, risk management, risk communication, scientific advice, value judgments. Sandøe is with the Centre for Bioethics and Risk Assessment, Department of Animal Science and Animal Health, Royal Veterinary and Agricultural University, Frederiksberg, Denmark. (JAEE)

Jensen, Karsten Klint, "Corporate Responsibility: The Stakeholder Paradox Reconsidered," *Journal of Agricultural and Environmental Ethics* 20(2007):515-532. Is it legitimate for a business to concentrate on profits under respect for the law and ethical custom? On the one hand, there seems to be good reasons for claiming that a corporation has a duty to act for the benefit of all its stakeholders. On the other hand, this seems to dissolve the notion of a private business; but then again, a private business would appear to be exempted from ethical responsibility. This is what Kenneth Goodpaster has called the stakeholder paradox: either we have ethics without business or we have business without ethics. Through a different route, I reach the same solution to this paradox as Goodpaster, namely that a corporation is the instrument of the shareholders only, but that shareholders still have an obligation to act ethically responsibly. To this, I add discussion of Friedman's claim that this responsibility consists in increasing profits. I show that most of his arguments fail. Only pragmatic considerations. Jensen is at the Danish Centre for Bioethics and Risk Assessment, Rolighedsvej 25, DK-1958 Frederiksberg C, Denmark

Part of the new and continuing dialogue between Western and non-Western environmental philosophers (see Guha, "Radical American Environmentalism and Wilderness Preservation: A Third World Perspective, Environmental Ethics 11 (1989):71-83. (Katz, Bibl # 2)

Johns, David M. "The Relevance of Deep Ecology to the Third World." Environmental Ethics 12(1990):233-52. Although Ramachandra Guha has demonstrated the importance of cross-cultural dialogue on environmental issues and has much to tell us about the problems of wilderness preservation in the Third World, I argue that Guha is partly wrong in claiming that deep ecology equates environmental protection with wilderness protection and simply wrong in calling wilderness protection untenable or incorrect as a global strategy for environmental protection. Moreover, I argue that the deep ecology distinction between anthropocentrism and biocentrism is useful in dealing with the two major problems which Guha identifies as undermining the health of the planet--overconsumption and militarism. Although it is true that preservation of wilderness will not be successful unless human social

dynamics are taken into consideration, nevertheless, a biocentrism which integrates critical social theory can provide the basis for an ethic that undercuts the environmental degradation from overconsumption and militarism more effectively than a human-centered system. Johnson, Andrew, "Sociobiology and Concern for the Future." Journal of Applied Philosophy 6 (1989): 141-148. Sociobiology makes a contribution to ethics because it reveals a purpose in human life--the natural aim to produce descendants. This biological purpose is an improvement on ideas of "everlasting progress" that lead to technological degradation of the earth---but it is still an anthropocentric model that does little for environmental ethics. (Katz, Bibl # 2)

Johnson, Andrew, "The Good, the Bad and the Ugly: Science, Aesthetics and Environmental Assessment," Biodiversity and Conservation 4(no. 7, 1995):758-766. Are there peculiarly scientific values that can be applied in environmental assessment? The use of the expression "scientific interest" is traced from its 19th century origins to modern British statutes. Attempts to replace expert judgments by objective scientific criteria (e.g. indices of biodiversity) can never be completely successful. In particular, "interest" is an aesthetic attribute valued by scientists but incapable of precise measurement. While science provides the best framework for informed judgments on conservation issues, the judgments of scientists are inevitably distinct from their experimental results. Judgments rest on ethical and aesthetic values such as importance and interest, which are essential constituents of the scientific sub-culture, but which are not uniquely "scientific." Johnson is the editor of White Horse Press, publishing environmental books in the United Kingdom. (v6,#4)

Johnson, Anne K., "The Influence of Institutional Culture on the Formation of Pre-Regime Climate Change Policies in Sweden, Japan and the United States," Environmental Values 7(1998): 223-244. This paper tests the claims of cultural theory using the formation of climate change policies in Sweden, the United States, and Japan as case studies. The theory posits that any social group consists of three main cultural types: the egalitarian, the market-oriented, and the hierarchical. Though all groups contain elements of each type, one cultural type usually prevails, giving the group its unique decision-making character. This paper applies cultural theory at the national level, testing to what extent the theory is able to project how countries will respond in addressing the issue of global warming. The results suggest that cultural theory may be useful to those involved in developing international agreements, enabling them to formulate regimes which are compatible with various cultural styles. KEYWORDS: climate change policies, cultural theory, greenhouse gases, Japan, Sweden, United States. Anne K. Johnson is at the

International Institute for Applied Systems Analysis, Laxenburg, Austria. (EV)

Johnson, Barbara Rose, ed., Who Pays the Price? The Sociocultural Context of the Environmental Crisis. Washington: Island Press, 1994.

Johnson, Baylor L., Ethical Obligations in a Tragedy of the Commons Environmental Values 12(2003): 271-287. When people use a resource without a co-ordinated plan the result is often a tragedy of the commons in which the resource is depleted. Many environmental resources display the characteristics of a developing tragedy of the commons. Many believe that each person is ethically obligated to reduce use of the commons to the sustainable level. I argue that this is mistaken. In a tragedy of the commons there is no reasonable expectation that individual, voluntary action will succeed. Our obligation is not fruitlessly to reduce individual use, but to support a collective agreement to reduce everyone's use to the sustainable level. (EV)

Johnson, Cassandra Y. and J. M. Bowker. "African-American Wildland Memories." Environmental Ethics 26(2004):57-75. Collective memory can be used conceptually to examine African-American perceptions of wildlands and black interaction with such places. The middle-American view of wildlands frames these terrains as refuges pure and simple, sanctified places distinct from the profanity of human modification. However, wild, primitive areas do not exist in the minds of all Americans as uncomplicated or uncontaminated places. Three labor-related institutions forest labor, plantation agriculture, and sharecropping and terrorism and lynching have impacted negatively on black perceptions of wildlands, producing an ambivalence toward such places among African Americans. (EE)

Johnson, Cassandra Y., J. M. Bowker, John C. Bergstrom, and H. Ken Hull, "Wilderness Values in America: Does Immigrant Status or Ethnicity Matter?" Society and Natural Resources 17(2004):611-628. If wilderness is a social construction, then perhaps wilderness is valued by U.S. born whites, and not by immigrants and minorities. Surveys show that immigrants are less likely to value on-site wilderness use. Blacks are also less likely to value on-site use, but are as likely as whites to value the continued existence of wilderness. Asians and Latinos are also less likely than whites to value on-site use. But there are some surprises. "U.-S. born Asians and women were more likely to indicate they believed the flora and fauna protected by wilderness had intrinsic value. ... The odds of an Asian respondent agreeing with this statement are about 3 times higher than for a White respondent, while a female is 1.63 times as likely to agree as a male" (p. 623).

Many differences are not statistically significant, beyond the fact that immigrant and minority groups expect to visit wilderness less, which may mostly be explained by the fact that they live in large cities and wilderness is not easy for them to visit. "For most of the value items, we cannot conclude that immigrants and natives perceive or construct wilderness in culturally different terms" (p. 624). On the basis of this study, the authors predict that "political support for wilderness may not diminish appreciably in the future as American becomes more diverse" (p. 625). Johnson, Bowker, and Hull are at the Southern Research Station, USDA Forest Service, Athens, GA; Bergstrom is in Agricultural and Applied Economics, University of Georgia.

Johnson, David Martel, How History Made the Mind: The Cultural Origins of Objective Thinking. Chicago: Open Court, 2003. The modern, Western mind is a product of the Greeks intellectual tradition,

unique in human history. Such minds can see nature objectively, as pre-Greeks could not (such as the Egyptians, where nature is tinged with fanciful mythology). This produces science in the West, which enables us not only to study and understand but to remake nature.

Johnson concludes: "We have to reconcile ourselves to the fact that, long into the foreseeable future, our world will contain an ever smaller percentage of its original 'wildness.' ... Our best hope of continuing to move towards a better world--or even of surviving--is by looking forward. Thus, in place of the once effective strategy of trying to tame wilderness, it now has become effective to create the sort of dynamically evolving, experimental, artificial (his emphasis) world that can help us meet our future needs." (p. 210). Johnson is in philosophy, York University, Toronto.

Johnson, Douglas B., "Green Businesses: Perspectives from Management and Business Ethics," Society and Natural Resources 11(1998):259-266. A new approach to environmental management and policymaking that gives science and scientists a crucial role in the policymaking process. Synthesizes the knowledge from many regions by examining the assessment process and detailing a series of case studies from around the country. (v.10,#1)

Johnson, Kirk, "Coloradoans Vote to Embrace Alternative Sources of Energy," New York Times, November 24, 2004, p. A13. Colorado voters approved, over the vehement objections of most energy companies, a proposal mandating that 10 percent of the state's electricity must come from wind and solar power by 2015. This energy proposal had failed three times in the state legislature but went to the polls and won. Colorado is the 18th U.S. state to set environmental friendly energy provisions in place, but is the first to do so by referendum. (v.14, #4)

Johnson, Kirk, "Filmmaking Where Acting Natural Comes With the Turf," New York Times, October 17, 2004. The nation's only film school dedicated to science and natural history is at Montana State

University. The program was founded with seed money from the Discovery Channel. (v.14, #4)

Johnson, Kirk, "How Drought Just Might Bring Water to the Navajo," New York Times, July 23, 2004, A16. The Navajo tribe has long claimed rights to the entire water supply of the San Juan River in New Mexico, a major tributary of the Colorado. If so, there would be no water for Gallup, NM and other areas, as well as reduced amounts for those on the Colorado River. In a proposed settlement, the tribe would get 55% of the river, a huge amount and more than some states get, as well as a federally constructed water supply system on the reservation, supplying water where many persons now have none (they have to drive trucks to get water now). But Gallup, NM would also get water in the deal, and many Navajos dislike that. River rights and racial tension. (v. 15, # 3)

Johnson, Kirk, "Debate Swirls Around the Status of a Protected Mouse," New York Times, June 27, 2004, p.14. The Preble's meadow jumping mouse is found in Colorado and Wyoming, and is on the Endangered Species List. But a prominent geneticist, Rob Roy Ramey II, says it does not differ genetically from the Bear Lodge meadow jumping mouse, found further north in Wyoming, Montana, and South Dakota, and which is not endangered. Ramey, at the Denver Museum of Nature and Science, says he firmly believes in protecting Endangered Species, but the Preble's mouse is not one. He also says this is only one case of what is often wrong with enforcing the Endangered Species Act: old and bad science that now needs to be replaced by genetically-based taxonomy. (v. 15, # 3)

Johnson, L., Padilla, D.K. "Geographic Spread of Exotic Species: Ecological Lessons and Opportunities from the Invasion of the Zebra Mussel Dreissena Polymorpha", Biological Conservation 78(no.1/2, 1996):23. (v7,#4)

Johnson, Lance, Philosophical Problems in the Evaluation of Genetic Engineering. M.A. thesis, Colorado State University, December 1998. Analysis of the ethical models that are used to consider the moral import of genetic engineering, a "scientific naysayer" model and an "intrinsically wrong model." Their evaluation involves the autonomy/provincialism debate in the philosophy of biology, the importance of ecology as a bridge between biology and the physical sciences, and the use of models in ecology. There are difficulties in assessing the potential effects of genetically engineered organisms released into the environment. This is demonstrated with a case study, a genetically modified canola (Brassica nigra), widely used and a plant with numerous wild relatives. Virus resistant plants are a special concern; genetically engineered microorganism are another. Rissler and Mellon's tiered approach to risk assessment here identifies two potential ethical difficulties. Genetically engineered organisms may be unique enough not to model analogously to wild species. Human activities disturbing the environment may invite invasive species problems; non-genetically engineered aggressive weedy species humans have introduced are already a quite serious problem. Users seeking commercial benefits are likely to underestimate the risks of harms. The thesis advisor was Holmes Rolston. Johnson is now finishing his teaching certificate in secondary school science at Metro State College, Denver, a post-baccalaureate certification. He has been for several years the supervisor of Inverness Water and Sanitation District, a subdivision of the Colorado state water authority, in the metro Denver area. (v.9,#3)

Johnson, Lawrence E., "Do Animals Have an Interest In Life", Australasian Journal of Philosophy, 61 (1983): 172-84. Does killing an animal - as distinguished from causing it pain - violate its interests? Does so killing a human violate his/her interests? The author maintains that it is possible for animals have an interest in life which does not entail a would-be preference. The claim is that animals have an interest in continued existence which is as viable as the claim that humans have an interest in continued existence. It is argued, in particular, that preference utilitarianism does not provide an adequate defence of the claim that only humans have an interest in life. The paper has particular application to Peter Singer's writings on the subject.

Johnson, Lawrence E. "Humanity, Holism, and Environmental Ethics." Environmental Ethics 5(1983):345-54. The human race is an ongoing entity, not just a collection of individuals. It has interests which are not just the aggregated interests of individual humans. These interests are morally significant and have important implications for environmental ethics. Johnson is at the School of Humanities, The Flinders University of South Australia, Bedford Park, Australia. (EE)

Johnson, Lawrence E., "Species: On their Nature and Moral Standing," Journal of Natural History 29(1995):843-849. If we exterminate a species, we adversely affect the well-being of individual organisms, human or otherwise, present and future, members and non-members of that species. But is that all there is to it? The extinction of a species is an enormity that goes beyond the fate of individual organisms, even as multiplied by big numbers. The species itself is of moral significance. But how can that be? That species are only aggregates of individuals may seem obvious, but only on the basis of a worldview that is fundamentally mistaken. Species are better thought of as living entities, which have moral standing in proportion to their nature and interests. Johnson teaches philosophy at Flinders University, Bedford Park, South Australia. (v6,#4)

Johnson, Lawrence E., A Morally Deep World: An Essay on Moral Significance and Environmental Ethics. New York: Cambridge University Press, 1990. 180 pages, \$ 39.50. Johnson advocates a major change in our attitude toward the nonhuman world. He argues that nonhuman animals, and ecosystems themselves, are morally significant beings with interests and rights. He considers recent work in environmental ethics in the introduction and then presents his case with precision and clarity. Written in an attractive, nontechnical style. Johnson is professor of philosophy, Flinders University, Australia. (v1,#4)

Johnson, Lawrence E. "Toward the Moral Considerability of Species and Ecosystems." Environmental Ethics 14(1992):145-57. I develop the thesis that species and ecosystems are living entities with morally significant interests in their own right and defend it against leading objections. Contrary to certain claims, it is possible to individuate such entities sufficiently well. Indeed, there is a sense in which such entities define their own nature. I also consider and reject the argument that species and ecosystems cannot have interests or even traits in their own right because evolution does not proceed on that level. Although evolution proceeds on the level of the genotype, those selected are able to cooperate in entities of various higher orders including species and ecosystems. Having their own nature and interests, species and ecosystems can meaningfully be said to have moral standing. Johnson is at the School of Humanities, The Flinders University of South Australia, Adelaide, South Australia. (EE)

Johnson, Lawrence E., "Humanity, Holism, and Environmental Ethics," Environmental Ethics 5(1983):345-354. An important paper that argues for a sense of "group interests" that transcend the interests of the individual members of the group. Johnson focuses on the interests of humanity as opposed to the interests of individual humans, and he hopes to generalize his conclusions to other areas of environmental ethics. But Johnson's argument (p. 350) seems to be based on the analogy between an individual organism and its constitutive elements: Smith has interests that are not the interests of his organs or cells. But it is unclear how this analogy works to supply interests for the species *Homo sapiens*. (Katz, Bibl # 1)

Johnson, Lawrence, Review of Don Marietta, Jr., For People and the Planet, Environmental Values 7(1998):485.

Johnson, Lawrence E., "Future Generations and Contemporary Ethics," Environmental Values 12(2003):

471-487. Future generations do not exist, and are not determinate in their make-up. The moral significance of future generations cannot be accounted for on the basis of a purely individualistic ethic. Yet future generations are morally significant. The Person-Affecting Principle, that (roughly) only acts which are likely to affect particular individuals are morally significant, must be augmented in such a way as to take into account the moral significance of Homo sapiens, a holistic entity which certainly does exist. Recent contributions to Environmental Values by Alan Carter and Ernest Partridge are criticised (but not entirely rejected). (EV)

Johnson, W. C., et al., "Vulnerability of Northern Prairie Wetlands to Climate Change," Bioscience 55(no. 10, October 2005): 863-872. The prairie pothole region (PPR) lies in the heart of North America and contains millions of glacially formed, depressional wetlands embedded in a landscape matrix of natural grassland and agriculture. These wetlands provide valuable ecosystem services and produce 50 to 80 of the continent's ducks. The most productive habitat for breeding waterfowl would shift under a drier climate from the center of the PPR (the Dakotas and southeastern Saskatchewan) to the wetter eastern and northern fringes, areas currently less productive or where most wetlands have been drained. Unless these wetlands are protected and restored, there is little insurance for waterfowl against future climate warming.

Arson at Vail Ski Resort aimed at protecting lynx habitat. The "Earth Liberation Front" (ELF) has claimed responsibility for burning several buildings and chair ski lifts at the 11,000-foot level of Vail Mountain, Colorado USA, causing \$12 million in damage. Environmentalists and many residents of Eagle County, where Vail is located, have opposed the resort's planned 885-acre expansion into mountainous back country that is potential habitat in which to restore lynx. An ELF email message to news organizations states: "Putting profits ahead of Colorado's wildlife will not be tolerated. This action is just a warning. We will be back if this greedy corporation continues to trespass into wild and unroaded areas." The environmental activist in Portland, Oregon, who sent out the communique for ELF, said: "As long as it doesn't harm humans lives, we approve."

In response, arch anti-environmentalist Ron Arnold of the Center for the Defense of Free Enterprise declared: "They've stepped over a line they've never crossed before. Now they no longer care what the public thinks." Newspapers are suggesting that such acts of "environmental terrorism" are increasing, citing the destruction of fences, burned livestock buildings, tree spiking to prevent logging, and acts by the Animal Liberation Front that include freeing animals from fur farms. Jolly, Alison, Lucy's Legacy: Sex and Intelligence in Human Evolution. Cambridge, MA: Harvard University Press, 1999. Human evolutionary nature was forged by living in small groups where our chief competitors were rival groups of hominids. We have tendencies to violence but we also have tendencies to co-operation, reciprocity, and to make social arrangements that counter our tendencies to violence.

"Natural selection mimics purpose. It blindly creates the exquisite complexity of living things. When Darwin showed how a purposeless mechanism could have done so, that brought existential despair. Darwinian nature seemed even worse than cruel. Darwinian nature was indifferent. ... The less fit died, or died childless, culled by their immediate environment. The laws acting around us include no laws of morality or altruism.

But particulate individualism is only part of the story. Cooperation between entities evolved even before life itself. The major transitions in evolution, the major increases in complexity, all arose from cooperation. ... One social species communicates through speech, writing, and now electronic impulses. This is leading us to a fifth level of cooperation, species wide, planetwide. ... The information revolution makes those links global. It is not simply language but electronic communication of language that gives humanity the potential to become a new biological entity. ...

We may choose despotism. ecological blight, death for other species. Or else we may

successfully improve our lot, stabilize our demands, preserve and enrich the biosphere. Biology has nothing to predict about which course we take. It only says that we are something new under the sun. ... We may become even more important, not as individuals but as a global organism. ... Gaia is not our mother. She could be our daughter" (pp. 431-434). Jolly is a distinguished primatologist at Princeton University. (v.11,#3)

The fundamental question of international distributive justice is: What obligations do the world's wealthy people have to ensure that the world's poor achieve a quality of life that is recognizably human? The relative merits of the utilitarian, human rights, and neo-Kantian perspectives. Nationalist, patriotic, relativist, and constitutivist challenges to universalism. Jones defends a form of cosmopolitanism involving a commitment to basic human rights, which can guide disputes about global justice. The moral case for change in the international system. Jones is in political science, University of Western Ontario. (v.10,#3)

Jones, Christopher D., and Hollenhorst, Steven J., "Toward a Resolution of the Fixed Anchors in Wilderness Debate," International Journal of Wilderness 8(no. 3, December 2002):15-20. Debate continues about technical climbers using fixed anchors in wilderness. Climbers and (other) environmentalists agree that if used they must be set by hand drill, not battery operated drill, but on little else. Many such fixed anchors were set before wilderness designation; some set by David Brower himself. Proponents say this insures legitimate and safe recreational use, in keeping with the intention of The Wilderness Act. Opponents say the bolts are forbidden "installations" and that climbers ought to face the mountains as did the first climbers, without preset aids. With such aids, the experience is less wild and less bold.

In 1998 U.S. Forest Service Chief Dombeck banned fixed anchors nationwide. There were many protests, and a powerful lobbyist, Recreational Equipment Incorporated (REI), headquartered in Washington state got their Senator to add a rider to the U.S.F.S. budget reversing the fixed anchor ban. A subsequent decision placed resolution in an appointed body of 23 stakeholders, if they could reach consensus; but they could not, so the matter remains unresolved. A big problem is the escalating number of climbers (especially now that climbing is safer with such aids), estimated at 8 million in the U.S. "A total ban of all fixed anchors would clearly have a major impact on the majority of wilderness climbers, a visitor group that has traditionally supported wilderness values and has been a strong voice in the wilderness movement. Yet, allowing unchecked fixed anchor installation represents a step backward in the century-old effort to protect wilderness values" (p. 19). Jones teaches physical education and recreation, Utah Valley State College, Orem, UT. Hollenhorst teaches recreation resources, University of Idaho.

Jones, Eileen Kerwin, "Weaving Perspectives: An Exploration of Economic Justice Based on the Work of Beverly Wildung Harrison and Marilyn Waring," Ecotheology Vol 6 (Jul 01/Jan 02):92-107. In this article, I underline the relevance of economic analysis in Christian social ethical deliberations on issues of justice. I show how connections are made between theological ethics, economics and ecology when Beverly Wildung Harrison, a Christian social feminist ethicist, and Marilyn Waring, a feminist economist, are in dialogue. I demonstrate how Waring's approach meets the four criteria of Harrison's adequate social

theory, and then suggest that Waring's economic insights provide critical data for theological reflection. Central to this article is the idea that conventional economic emphasis on the market presents only a partial analysis of the economy; it omits significant data, such as the work performed in the informal sector (work done mostly by women) and any costs due to environmental damage. This partial analysis poses both an economic and a moral problem. By weaving the perspectives of Harrison and Waring, the injustice is clearly detailed. This is seen as furthering a theological commitment to justice, not only for women, but also for all human beings and the natural world upon which we depend.

Journal of Environment and Development is published twice a year, concerned with development and conservation, especially on international levels. Seeks to combine legal, scientific, policymaking, and academic communities. Sample articles: William K. Reilly, "The Greening of NAFTA: Continental Environmental Cooperation" (Winter 1993); Heraldo Munoz, "The 'Green' vs. Trade Debate in the Americas" (Winter 1994). JED, University of California at San Diego, Mail Code 0519, La Jolla, CA 92093. Phone 619/534-7617. (v5,#4)

Journal of Forestry, "Ethical Decisionmaking: A Roundtable Discussion," vol. 91, no. 4, April 1993. Contains:

Banzhaf, William H., "Rarely Black and White"

Irland, Lloyd C., "Developing Ethical Reflection"

Marshall, Fred, "Ethical Priorities"

Coufal, James E., and Zane J. Cornett, "The Ethics of Forest Stewardship"

The issue theme is "Environmental Ethics and Policies: Assessing the Benefits and Consequences." (v5,#4)

Journal of Forestry 93 (no. 9, September 1995) is a theme issue on ethics in forestry, "Word of Honor: The Role of Professional Ethics in Forestry." contains:

--Cornett, Zane J., "Birch Seeds, Leadership, and a Relationship with the Land"

--"Code of Ethics for Members of the Society of American Foresters"

--Force, Jo Ellen, "SAF's Code of Ethics: Time for Another Look?"

--"The Case of the Missing BMP's." A forest engineer working for a forestry company is asked to evaluate a piece of property recently received in trade from a government agency. He finds that a partially constructed road does not comply with volunteer best management practices (BMP). Following his report to his supervisors, his company puts the land on sale. Among others, his church is considering buying the land. Comments on this case by several foresters.

Journal of International Affairs, Winter 1991 issue is devoted to the theme "The Politics of the Global Environment." Eight contributors investigate international cooperation, economic development and the environment, and the role of the market in fashioning sound environmental policies. Single issue is \$ 7.00, JIA, Box 4, International Affairs Bldg, Columbia University, New York, NY 10027. (v2,#2)

Journal of Environmental Psychology, vol. 15, no. 3 (September 1995), is a special issue on Green Psychology, edited by Robert Gifford. Included are:

--Axelrod, Lawrence J., and Suedfeld, Peter. "Technology, Capitalism, and Christianity: Are They Really the Three Horsemen of the Eco-Collapse?" pp. 183-95. An examination of the evidence for the frequent accusation that technology, capitalism, and Christianity, the three bases of modern Western Society, are root causes of environmental degradation. Although these three are associated with failures to protect the environment, label them as causal factors contradicts known facts. Axelrod and Suedfeld are in psychology at the University of British Columbia.

--Biel, Anders, and Garling, Tommy. "The Role of Uncertainty in Resource Dilemmas," pp. 221-

33. Resource dilemmas entail a conflict between self-interests and the welfare of a group or society at large. Individuals with a pro-social orientation may act in the interest of the collective, but there are complications due to uncertainty. As the consequences are perceived to be uncertain, increasing uncertainty will be cooperation less consistent. Biel and Garling are in psychology, Göteborg University, Göteborg, Sweden.

--Reser, Joseph P. "Whither Environmental Psychology? The Transpersonal Ecopsychology Crossroads," pp. 235-57. Ecopsychology and its relationship to psychology and environmental psychology, with particular attention to Theodore Rozak. The nature and role of the "self" as the ultimate target and agent of meaningful change. Ecopsychology in Australia, and indigenous "earth wisdom." The prognosis for the greening of psychology is explored. Reser is in psychology at James Cook University, Townsville, Australia.

--Kaplan, Stephen. "The Restorative Benefits of Nature: Toward an Integrative Framework," pp. 169-82. Evidence pointing to the psychological benefits of nature has accumulated at a remarkable rate in a relatively short period of time. Natural environments are particularly rich in the characteristics necessary for restorative experiences. Kaplan is in psychology at the University of Michigan, Ann Arbor. (v7, #3)

Journal of Social Issues had a special issue on "Psychology and the Promotion of a Sustainable Future," edited by Doug McKenzie-Mohr and Stuart Oskamp, Vol. 51, no. 4 (Winter 1995). Twelve articles, including the 1994 Society address by Stuart Oskamp, "Apply Social Psychology to Avoid Ecological Disaster." Included is an article by John B. Cobb, Jr., "Toward a Just and Sustainable Economic Order." Available from Plenum Press (New York, London). (v8,#2)

Journal of Human Dimensions in Wildlife Management is a new journal, to advance the science of human dimensions of wildlife and its application to decision-making concerning wildlife conservation. Sample articles in volume 1, no. 1, Spring 1994. "Understanding Controversy in Wildlife Management"; "Basic Wildlife Beliefs, Orientations, and their Applicability to Wildlife Planning." The publisher is Sagamore Publishing Inc., Champaign, IL. Articles are invited: Co-editors, Michael J. Manfredo and Jerry J. Vaske, Human Dimensions Natural Resources Unit, College of Natural Resources, Colorado State University, Fort Collins, CO 80523. (v5,#3)

Journal of Ecotourism. Seeks to advance the development of a viable global ecotourism industry that is environmentally, socio-culturally, and economically sustainable. Started in 2001. www.channelviewpublication.net

Journal of Philosophy of Education (The Journal of the Philosophy of Education Society of Great Britain), volume 37, no. 4, 2003, is devoted to environmental education. Michael Bonnett, editor, writes in the introduction: "At this state in history it is difficult to identify an issue of greater importance for humankind than its relationship with the environment, nor one that is more fraught. It must be a unique phenomenon--on Earth at least--for a species to be contemplating the possibility of its self-extinction. Yet as evidence mounts daily to confirm that human action is affecting the environment in ways that are both unprecedented and unsustainable, the issues raised appear ever more complex and the way ahead far from straightforward. Given that the consequences of this situation are having to be faced in increasingly acute forms by the citizens of the early twenty-first century, clearly it would be irresponsible for education somehow to attempt to remain aloof from the issues that this state of affairs throws up."

Journal of Catholic Social Thought Vol. 4, no. 2 (2007). This is a themed issue on Catholic social teaching and ecology. Contents include: (1) "Introduction: Catholic Social Teaching and Ecology," by Barbara Wall (pp. 199-202), (2) "Catholic Social Teaching and Ecology: An Historical Perspective" by Bishop Walter Sullivan, Diocese of Richmond (pp. 203-09), (3) "Catholic Social Teaching and the Environment: A Pastoral Response" by Walter Grazer, U.S. Conference of Catholic Bishops (pp. 211-25),

Joyce, Richard. *The Evolution of Morality*. Cambridge, MA: The MIT Press, 2006. The evidence supports an innate basis to human morality. Might the fact that the human brain has been biologically prepared by natural selection to engage in moral judgment serve in some sense to vindicate this way of thinking - staving off the threat of moral skepticism, or even undergirding some version of moral realism? The evolutionary "vindication" of morality compared with the evolutionary "debunking" of morality.

African countries have the potential to move into the field of biotechnology, but they are hindered by the

lack of coherent national policies. (v6,#3)

Jung, Hwa Yol. "The Orphic Voice and Ecology." Environmental Ethics 3(1981):329-40. The voice of Orpheus symbolizes the everlasting importance of music and poetry in the animus of man. According to the ancient legend, Orpheus by his very gift of music fills the radical sense of enjoyment in us all and enables entire nature to dance in delight. Music resonates the most primordial and invariant mood of man in his harmony with the universe (uni-verse) from time immemorial. On the basis of the image of "roundness" derived from the auditory model of space, an "ecotopia" or a new orientation of ecological ethics is projected. By affirming man as the responsible caretaker of the Earth, it rejects both speciesism and individualism--the antitheses of social principle. Jung is in the department of Political Science, Moravian College, Bethlehem, PA. (EE)

Jung, Hwa Yol. "Marxism, Ecology, and Technology." Environmental Ethics 5(1983):169-71. The recent controversy over whether Marxism is an ecologically viable theory or can justify a state of harmony between man and nature has a serious flaw because none of the participants in the discussion seems to think that technology is intrinsic to the reconciliation of man with nature. While it is correct that the writings of the early Marx offer some basis for the reconciliation, the later Marx was preoccupied with the question of nature's instrumentality or the human significance of nature, and he saw technology as the human mode of dealing with nature. Marx and Marxists have contributed to making us aware of man's exploitation of and alienation from other men, but not man's exploitation of and alienation from nature. To eradicate the second requires a radical deconstruction of modern technomorphic culture and its metaphysical foundations. Jung is in the department of Political Science, Moravian College, Bethlehem, PA. (EE)

Kahn, Joseph, "The Science and Politics of Super Rice," New York Times, October 22, 2002, pp. C1, C12. China was once enthusiastic about genetically modified, pesticide resistant rice, and the Chinese at their National Rice Research Institute, Hangzhou, have developed such a rice. But now the Chinese are going quite slow about using it, worrying that pests quickly evolve to overcome the resistance (as has happened with corn in China). Even more they seem to fear that Chinese inefficient farmers cannot compete with food imports from the United States and other big high-tech producers. (v.13,#4)

Kahn, Jr, Peter H., "Developmental Psychology and the Biophilia Hypothesis: Children's Affiliation with Nature," Developmental Review 17(1997):1-61. A useful review of the biophilia hypothesis of Edward O. Wilson and Stephen R. Kellert. There are three overarching concerns: (1) The genetic basis of biophilia. (2) How to understand seemingly negative affiliations with nature. (3) The quality of the supporting evidence. Biophilia is a valuable interdisciplinary framework for investigating the human affiliation with nature, though a nascent framework. The second half of the article discusses recent studies on children's environmental reasoning and values, conducted in the U.S. and in the Brazilian Amazon. Kahn is in education and human development, Colby College, Waterville, ME. (v9,#1)

Kahn, Jr., Peter H., "Children's Moral and Ecological Reasoning About the Prince William Sound Oil Spill," Developmental Psychology 33(No. 6, 1997):1091-1096. School children were interviewed about the 1990 Exxon Valdez oil spill. Children cared that harm occurred to the shoreline and marine life and conceived of both types of harm as violating a moral obligation. Fifth and eighth graders used more anthropocentric reasoning than did second graders. (v9,#1)

Kahn, Jr., Peter H., and Batya Freidman, "Environmental Views and Values of Children in an Inner-City Black Community," Child Development 66(1995):1403-1417. Overall, children showed sensitivity to nature and awareness of environmental problems, although attenuated by both developmental and cultural factors. Most children believed that polluting a waterway was a violation of a moral obligation. Children's environmental moral reasoning largely focused on homocentric considerations (e.g. that nature ought to be protected in order to protect human welfare). With much less frequency, children focused on biocentric considerations (e.g. that nature has intrinsic value or rights). Findings are discussed in terms of moral-developmental theory, and the place of social-cognitive research in understanding the human relationship to the natural environment. Kahn and Friedman are in human development at Colby College, Maine. (v6,#4)

Kahn, P. H. , and Lourenco, O., "Water, Air, Fire, and Earth: A Developmental Study in Portugal of Environmental Moral Reasoning," Environment and Behavior 34(no.4, 2002): 405-30. (v.13,#4)

Kahn, Peter H., Jr., The Human Relationship with Nature: Development and Culture. Cambridge, MA: MIT Press, 1999. 281 pages. Research and theory on how humans develop a relationship with nature, using a developmental psychology framework. An analysis of eight years of study of children, young adults, and parents in diverse geographical locations, ranging from an economically impoverished black community in Houston, Texas, to a remote village in the Brazilian Amazon. Features children, with the question how far environmental sensitivity is already present in children and how far it develops in later life. Analyzes whether there are universal features in the human relationship with nature, and discovers some tendencies toward biophilia transculturally, with cultural modifications. Challenges the postmodern claim that nature is only a cultural construction. An excellent combination of philosophical analysis and empirical research. Kahn is in psychology at Colby College, Waterville, Maine. (v.10,#2)

Kahn, Peter H., Jr., "Bayous and Jungle Rivers: Cross-Cultural Perspectives on Children's Environmental Reasoning." In Saltzstein, H., ed., Culture as a Context for Moral Development: New Perspectives on the Particular and the Universal. No. 76 in the series, New Directions for Child Development, Summer 1997, pp. 23-36. San Francisco: Jossey-Bass, Inc., Publishers. Contrary to previous research that found that economically impoverished African Americans have little interest in and concern for the natural environment, research with children and parents in an African American community in Houston, Texas shows environmental sensitivity and commitment. Two groups are studied in Brazil, one in Manaus, a large city on the Amazon River, where children live in great poverty, and a second group in a remote village of 4,000 inhabitants on the Rio Negro. Both groups of children demonstrated environmental sensitivities and commitments based on a wide range of measures. Similarly in Howe, Daniel C. (Education and Development, Colby College) and Kahn, Jr., Peter H., "Along the Rio Negro: Brazilian Children's Environmental Views and Values," Developmental Psychology 32(No. 6, 1996):979-987. (v9,#1)

Kahn, Peter H., Jr., and Kellert, Stephen R., eds., Children and Nature: Psychological, Sociocultural, and Evolutionary Investigations. Cambridge, MA: MIT Press, 2002. Experience of the natural world has traditionally been significant in the maturing of children, and it still may be a critical component of human physical, emotional, intellectual, and even moral development. Research from cognitive science, developmental psychology, ecology, education, environmental studies, evolutionary psychology, political science, primatology, psychiatry, and social psychology on the formation of children in interaction with the natural world. (v.13,#2)

Kahn, Peter H., Jr., "Resolving Environmental Disputes: Litigation, Mediation, and the Courting of Ethical Community." Environmental Values 3(1994):211-228. Litigation and mediation offer substantive and important approaches toward resolving environmental disputes. Yet as currently practiced both approaches have shortcomings. For example, litigation often promotes divisive, adversarial relationships. Mediation often yields untenable ground given the seriousness of many environmental problems. This paper offers a reconception of both approaches. It is argued that both litigation and mediation need to be embedded within a more ethically comprehensive context, one of 'courting ethical community'. Discussion focuses on what it means in this sense to court, on what defines and bounds the ethical, and how courting depends on understanding not only differences but commonalities in people's environmental views and values. KEYWORDS: Community, environmental dispute resolution, environmental ethics, litigation, mediation, moral psychology, morality. Kahn is at the Department of Education and Human Development at Colby College, Maine. (EV)

Kahn, Peter H., Jr., "Developmental Psychology and the Biophilia Hypothesis: Children's Affiliation with Nature." Paper at the April 1995 Society for Research in Child Development. A venturesome hypothesis has been put forth by E. O. Wilson, and is gaining increasing support: biophilia is a fundamental, genetically-based human need and propensity to affiliate with other living organisms and life-like

processes. While the biophilia hypothesis can help us to understand the biological underpinnings of how humans come to value nature, the construct itself needs to include substantively ontogenetic considerations. An alternative means, by which to understand biophilia, is grounded in structural-development psychological theory. Data from three recent studies conducted in the United States and the Brazilian Amazon support this reconception. Paper available from the author at: Program in Education and Human Development, Colby College, 4420 Waterville, ME 04901-8844.

Kahn, Peter and Stephen Kellert, Children and Nature: Psychological, Sociocultural and Evolutionary Investigations. Cambridge, MA: The MIT Press, 2002. Reviewed by David Sobel. Environmental Values 13(2004):409-412. (EV)

Kaiser, Jocelyn, "Military Wins Changes that May Ease Research," Science 302(28 November 2003):1487-1488. The U.S. Congress has exempted the Department of Defence from environmental rules protecting endangered species and marine mammals. Congress did reject military requests for exemption from some pollution laws. Also, language of the law is rather vague at points, especially regarding whether the military itself or subcontractors do the research.

Kaiser, Jocelyn, "Academy Panel Mulls Ethics of Human Pesticide Experiments," Science 299(17 January 2003):327-328. Ethics of human pesticide studies. The U.S. Environmental Protection Agency sets permissible levels of human exposure to pesticides at 10-fold or more lower than the dosage that produces toxicity in animals, levels that might even get lower with new regulations protecting children. To get more data on human toxicity levels, and to avoid such stringent standards, a number of companies have been dosing volunteers (mostly in the U.K.) with experimental levels of pesticides, and paying them \$ 600 or more to participate in such tests. The National Academy of Sciences has a panel questioning whether such experiments are ethical, and the EPA is undecided whether they can or ought to use such data. Much of the ethics debate hinges on whether the industry motives are perceived to be expressly for the benefit of the company or conducted with larger benefits to society as a goal.

Kaiser, Jocelyn, "Unique, All-Taxa Survey in Costa Rica 'Self-Destructs,'" Science 276 (1997)893. A unique, all-taxa survey in Costa Rica fails. A promising survey of all the species in species-rich Costa Rica, designed co-operatively among a number of groups, including the World Bank, the Netherlands, and Norway, has failed, rather unexpectedly. One spokesman said, "The ATBI (survey) was a beautiful scientific project, but there are social and economic considerations that are more relevant than scientific ones." The \$ 90 million project was canceled because it seemed to benefit science more than the Costa Rican people. (v8,#3)

Kaiser, Jocelyn, "Booby-Trapped Letters Sent to 87 Researchers," Science 286(5 November 1999):1059. Letters with razor blades, and a note: "You have until August 2000 to release all of your primate captives and get out of the vivisection industry," have been sent to 87 researchers in the U.S. The responsible group seems to be one called "The Justice Department," originating in the U.K. (v10,#4)

Kaiser, Jocelyn, "Population Growing Pains," Science 279(1998):1309. Does adding more people to the planet make society any worse off? Economists have tended to reject gloom and doom scenarios of impending environmental catastrophe, concluding that population growth should only slightly perturb living standards. But two economists, William Nordhaus and Joseph Boyer, of Yale University, argue that, although the next generation may not be much affected, if one projects eight or so generations, the cost can become enormous. Most of the costs are diminishing returns as land and capital are divvied up among descendants. Short story. This could seem obvious simply by thinking about it, but at least economists are making common sense respectable!

Kaiser, Jocelyn, "Science Board Floats \$ 1 Billion Trial Balloon," Science 285(1999):816-817. \$ 1 billion

for environmental science? The U.S. National Science Foundation (NSF) has a recommendation from its governing board to increase support of environmental science, following years of criticism that it pays environmental research short shrift. The recommendation increases spending from \$ 600 million to \$ 1.6 billion in five years. NSF Director Rita Colwell is herself an ecologist. Chair of the NSF panel that produced the report is Jane Lubchenco, Oregon State University. (v. 10, # 3)

Kaiser, Jocelyn, "New Wetlands Proposal Draws Flak," Science 279(1998):980. The Army Corps of Engineers has proposed revisions to current policy, which, though from one perspective can seem to be more conservative about wetlands, in fact opens up the possibility of much more wetland development, say critics. (v9,#1)

Kaiser, Jocelyn, "Caribou Study Fuels Debate on Drilling in Arctic Refuge," Science 296(19 April 2002):444-445. Caribou study fuels debate on drilling in Arctic refuge. The US Department of Interior, US Geological Survey, released a report that said oil drilling would harm caribou in the Arctic National Wildlife Refuge (ANWR), a report that came out on the eve of a Senate vote on drilling. But a week later there was a hastily done addendum, with revised conclusions. Some interpreted this as Interior Secretary Gail Norton manipulating science to promote the Bush Administration's views. Other scientists say the first report was based on a larger drilling area, which has since been reduced in size, and hence the addendum. Also the debate turns not only on where the caribou calve, but on where they then go to escape insects. Meanwhile other geologists note that best estimates are that drilling in ANWR would reduce U.S. dependence on foreign oil from 62% to 60%, a drop in the bucket. (v.13,#2)

Kaiser, Jocelyn, "Rift over Biodiversity Divides Ecologists," Science 289(25 August, 2000):1282-1283. An acrimonious dispute has broken out over whether the data on biodiversity are robust enough to inform public policy. The stability-diversity connection flares up again--this time when the Ecological Society of America distributed a pamphlet to members of Congress and federal agencies advocating the importance of biodiversity and citing research connecting it with ecosystem stability. Other ecologists retort that the biodiversity studies are "irrelevant" and "politically manipulated," a "propaganda document."

Kaiser, Matthias, et al., "Developing the ethical matrix as a decision support framework: GM fish as a case study," Journal of Agricultural and Environmental Ethics 20(2007):65-80. The Ethical Matrix was developed to help decision-makers explore the ethical issues raised by agri-food biotechnologies. Over the decade since its inception the Ethical Matrix has been used by a number of organizations and the philosophical basis of the framework has been discussed and analyzed extensively. The role of tools such as the Ethical Matrix in public policy decision-making has received increasing attention. In order to further develop the methodological aspects of the Ethical Matrix method, work was carried out to study the potential role of the Ethical Matrix as a decision support framework. When considering which frameworks to apply when analyzing the ethical dimensions of the application of agri-food biotechnologies, it is important to clarify the substantive nature of any prospective framework. In order to further investigate this issue, reflections on the neologism "ethical soundness" of an ethical framework are presented here. This concept is introduced in order to provide more structured evaluations of a range of ethical tools, including ethical frameworks such as the Ethical Matrix. As well as examining the philosophical dimensions of the method, theoretical analysis and literature studies were combined with stakeholder engagement exercises and consultations in order to review the Ethical Matrix from a user perspective. This work resulted in the development of an Ethical Matrix Manual, which is intended to act as a guide for potential user groups. Keywords: biotechnology - decision support - Ethical frameworks - Ethical Matrix - GM fish. Kaiser is with the National Committee for Research Ethics in Science and Technology (NENT), Sentrum, Prinsensgate, Oslo, Norway.

Characters of various whales have been aggregated and escalated to create a mythical "super whale", as a "totem animal" for environmentalist activists. In result all whales are majestic, gentle, warm-blooded animals that mate for life, travel in family groups, feel pain, and are incredibly intelligent. Whales are thereby put in a category apart from all other animals, such as those that are otherwise routinely harvested. This is more rhetoric that serves the cause of environmentalist activists than truth about whales. (v.13,#2)

survey, tested three measures of religious activity (attendance at church, born-again Christian, personal religion) in relationship to three environmental attitudes (increase federal spending, relax environmental controls for economic growth, self-identification as an environmentalist), and found various connections, but, "overall, our interpretation of these findings challenges the dominant view that those in Judeo-Christian traditions--particularly religiously conservative individuals in these traditions--are less concerned about environmental issues than are others. The authors are at The Pennsylvania State University. (v8,#3)

Kane, Hal. Triumph of the Mundane: The Unseen Trends that Shape Our Lives and Environment. Covelo, CA: Island Press, 2000. 208 pages. Cloth \$22.95. How and why our day-to-day lives have changed in recent decades, and the wide-ranging impacts of those changes. Using a variety of indicators--distances between family members, the things we own, the pace of our lives, he traces the social transformations that have occurred, and considers the profound effects of those changes on our values, relationships, and physical surroundings. (v.11,#4)

Kanis, Egbert, Groen, Ab F. and De Greef, Karel H., "Societal concerns about pork and pork production and their relationships to the production system," Journal of Agricultural and Environmental Ethics 16(2003):137-162. Pork producers in Western Europe more and more encounter a variety of societal concerns about pork and pork production. So far, however, producers predominantly focused on low consumer prices, therewith addressing just one concern. This resulted in an intensive and large-scale production system, decreasingly related to the area of farm land, and accompanied with increasing concerns about safety and healthiness of pork, animal welfare, environmental pollution, and others. An overview is given of possible concerns about West-European pork production with the consumers, citizens, and producers, and those concerns are traced back to the pork production system. Accounting for the type and relevance of the concerns, legislation is necessary to address societal concerns in a balanced way such that pork production systems become acceptable for the majority of our society. KEY WORDS: acceptability, actors, dealing with concerns, pork production system, quality schemes. (JAEE)

Kant, Sashi and Susan Lee, "A Social Choice Approach to Sustainable Forest Management: An Analysis of Multiple Forest Values in Northwestern Ontario," Forest Policy and Economics 6(2004):215-227. Market value techniques for valuing forests are limited. Multiple forest values are closer to the concept of "social states" than market price or monetary value. A multiple values account tested in Northwestern Ontario. A need for developing context-specific social welfare maximizing inter-group preferences aggregation rules is highlighted. Kant and Lee are at the Faculty of Forestry, University of Toronto.

Kantor, Jay E. "The `Interests' of Natural Objects." Environmental Ethics 2(1980):163-71. Christopher D. Stone has claimed that natural objects can and should have rights. I accept Stone's premise that the possession of rights is tied to the possession of interests; however, I argue that the concept of a natural object needs a more careful analysis than is given by Stone. Not everything that Stone calls a natural object is an object "naturally." Some must be taken as artificial rather than as natural. This type of object cannot be said to have intrinsic interests and hence cannot be given rights that can protect "its own sake"--which is the sort of right that Stone focuses on. Further, there are other sorts of natural objects which, although they are objects "naturally," cannot meaningfully be said to have intrinsic interests, and thus cannot have the sorts of rights that Stone is concerned with. Finally, there are other sorts of natural objects which are objects naturally and which have intrinsic interests, but which are not proper candidates for the possession of rights. The prerequisites for being "owed" rights are the possession of intrinsic interests and the capability to suffer when those interests are interfered with or denied or threatened. Kantor is in the department of philosophy, Long Island University, Brooklyn, NY. (EE)

Kapczynski, Amy, Crone, E. Tyler, and Merson, Michael, "Global Health and University Patents," Science 301 (19 September 2003):1629. A fierce debate rages about whether and when patents promote

innovation in life-saving medicines and technologies; but, meanwhile, universities are taking out patents in unprecedented numbers. A group of experts recently concluded that universities can improve and save lives by working collectively to adopt access-friendly intellectual property. This will require developing specific licensing and patenting strategies that are applicable to low and middle-income countries. (v.14, #4)

Kaplan, Rachel and Stephen Kaplan, The Experience of Nature. New York: Cambridge University Press, 1989. 340 pages. An assessment of scientific-academic studies that analyze the various kinds of experience of nature that persons have. Is the effect of nature on people as powerful as it intuitively seems to be? How does it work? What lies behind the power of environments that not only attract and are appreciated by people but are apparently able to restore hassled individuals to healthy and effective functioning? Are some natural patterns better than others? Is there a way to design, manage, to interpret natural environments so as to enhance these beneficial influences? Part I deals with research on the perception of and preference for natural environments. There are broad areas of agreement, and variations. Part II deals with research on the satisfactions and benefits people derive from contact with natural environments, with particular attention to wilderness environments, but also to nearby nature, such as gardens. Part III develops the concept of a restorative environment in which the recovery of mental energies and effectiveness is enhanced. The Kaplans are in natural resources at the University of Michigan. Kaplan, Robert D., "The Coming Anarchy," The Atlantic Monthly, vol. 273, no. 2, February 1994. Nations break up under the tidal flow of refugees from environmental and social disaster. As borders crumble, another type of boundary is erected--a wall of disease. Wars are fought over scarce resources, especially water, and war itself becomes continuous with crime, as armed bands of stateless marauders clash with the private security forces of the elites. The world faces a period of unprecedented upheaval, brought on by scarce resources, worsening overpopulation, uncontrollable disease, brutal warfare, and the widespread collapse of nation-states, and, indeed, of any semblance of government. A preview, the author claims, of the first decades of the twenty-first century. (v5,#1)

Kaplan, Stephen. "The Restorative Benefits of Nature: Toward an Integrative Framework," Journal of Environmental Psychology, vol. 15, no. 3 (September 1995): 169-82. Evidence pointing to the psychological benefits of nature has accumulated at a remarkable rate in a relatively short period of time. Natural environments are particularly rich in the characteristics necessary for restorative experiences. Kaplan is in psychology at the University of Michigan, Ann Arbor. (v7, #3)

Karafyllis, Nicole C., "Renewable resources and the idea of nature - what has biotechnology got to do with it?" Journal of Agricultural and Environmental Ethics 16(2003):3-28. The notion that the idea of nature is not quite the unbiased rule to design sustainable futures is obvious. But, nevertheless, questions about nature, how it functions and what it might aim at, is leading the controversial debates about both sustainability and biotechnology. These two research areas hardly have the same theory background. Whereas in the first concept, the idea of eternal cyclical processes is basic, the latter focuses on optimization. However, both concepts can work together, but only under a narrow range of public acceptance in Europe. KEY WORDS: bioenergy, biofuels, eco-ethics, efficiency, functions, philosophy of science, plant biotechnology, public acceptance, renewable resources, sustainability, technology assessment. (JAEE)

Karant, K. Ullas, and Madhusudan, M.D. "Avoiding Paper Tigers and Saving Real Tigers: Response to Saberwal," *Conservation Biology* 11(no.3, 1997):818-820. The situation is critical and urgent, and, while everyone hopes for local based-decisions, the social reform of existing practices comes quite slowly; by then tiger will be extinct. In the last 6-7 years there has been a sharp deterioration of wildland protection in India, with cutbacks of staff and resources, with dramatic increase in poaching, 200-400 killed annually for the traditional medicine trade. There is also a great increase in local hunting of the ungulates which are the tiger prey base. The tiger lives in areas characterized by rising human populations that are economically and politically marginalized, a situation not likely soon to change. India has a land area of over 3 million km² and it is not unreasonable to set aside a few inviolate 500-1000 km² sanctuaries, core conservations refuges that are part of a more extensive tiger conservation matrix. Lions are different, and there is no site in Asia where high density, productive tiger populations exist with high density agricultural and pastoral human occupation. Relocations should be voluntary, the present encroachments on tiger habitat are not sustainable, and are no long-term solution. The authors are with the Wildlife Conservation Society, Bangalore, India. (v8,#2)

Karesh, William B., "Wildlife Rehabilitation--Additional Considerations for Developing Countries," *Journal of Zoo and Wildlife Medicine* 26(no. 1, 1995):2-9. Wildlife rehabilitation in developing countries faces veterinary challenges no longer a problem for most programs in North America and Europe: availability of local vets, competent and qualified workers, access to medical information, lack of equipment, supplies, pharmaceuticals, diagnostic capacities, control of contagious diseases during care, and general lack of financial resources, as well as political pressures for politically correct rehabilitation. Care of a single primate can cost more than the combined salaries of two park rangers, protecting animals in the wild, leading some to wonder whether such money might be better spent protecting wild animals. Karesh is with the Department of Field Veterinary Studies, Wildlife Health Sciences, Wildlife Conservation Society, Bronx, NY, associated with the Bronx Zoo. (v.10,#1)

Kargel, Jeffrey S., "Proof for Water, Hints of Life?" *Science* 306(3 December 2004):1689-1690. Recent Mars probes have established there was water, but whether there was (or is) life remains uncertain. Nevertheless, "given what we now know about Mars, planetary protection considerations require the assumption that martian life exists, until we learn otherwise. All possible care must be taken to avoid cross-contamination between Earth and Mars. ... The possible future discovery of life (or fossil life) beyond Earth, anticipated for millennia, would complete the Galilean revolution that removed Earth and its life from the center of the universe. Alternatively, if we search martian aqueous deposits and find them barren, then Earth might be seen as the only land of the living for light-years around. Methane and salts may then provide humans with raw materials for building a new civilization on Mars and with an increased respect for life on our own planet." Kargel is with the U.S. Geological Survey, Flagstaff, AZ.

Karjalainen, Timo Pauli and Joachim Otto Habeck, "When 'The Environment' Comes to Visit: Local Environmental Knowledge in the Far North of Russia," *Environmental Values* 13(2004):167-186. Based on field research in villages and towns in the Komi Republic (northeastern European Russia), this article

compares the perception of the environment with environmental knowledge, and examines their interrelations in local contexts. An individual's perception of the environment is embedded in his/her everyday engagement with the surroundings ('the environment' as seen from within). Environmental knowledge is of more cognitive character: it originates mainly from outside the context of everyday life and is imparted via various forms of communication ('The Environment' as seen from the outside). From the interplay of these two levels arises what we call local environmental knowledge, a kind of knowledge which has its own moral and symbolic dimension within the social, cultural and political setting. Similarly, the concept of environmentalism is increasingly recognised as a wide diversity of 'green' views and actions rather than as a single project of a globally consistent normative character; thus there is a need to examine the contextuality of environmental concern. Our findings explain the failure of the 'information deficit' model, according to which the dissemination of scientific knowledge about environmental problems should result in local inhabitants changing their attitudes towards 'The Environment'. Instead, our findings support the insight that, rather than accepting environmental knowledge from external sources as a factual given, individuals restate it in terms of their everyday life contexts and local discourses about socio-political issues. Karjalainen is in Sociology and Environmental Studies, Faculty of Education, University of Oulu, Finland. Habek is in anthropology, University of Aberdeen, UK. (EV)

Karliner, Joshua, Morales, Alba, O'Rourke, Dara. "The Barons of Bromide: The Corporate Forces Behind Toxic Poisoning and Ozone Depletion," The Ecologist (1979) 27(no.3 1997):90. The pesticide, methyl bromide, poisons farm workers and communities and destroys the ozone layer. A broad coalition is working for the chemical's rapid and total phase-out worldwide and its replacement by sustainable agricultural practices. Methyl bromide's manufacturers, however, are lobbying hard at local, national and international levels to keep the chemical on the market. (v8,#3)

Karliner, Joshua. "Co-opting the UN." The Ecologist 29(No. 5, August 1999):318- . The UNDP's new "GSDF" programme links the UN with some of the world's worst corporations, with the aim of "bringing 2 million more people to the market" early next century. (v10,#4)

Karlsson, Mikael, "Ethics of sustainable development - A study of swedish regulations for genetically modified organisms," Journal of Agricultural and Environmental Ethics 16(2003):51-62. In spite of stricter provisions in the new EU directive on deliberate release of genetically modified organisms (GMOs), critics still advocate a moratorium on permits for cultivation of GMOs. However, in an attempt to meet concerns raised by the public, the directive explicitly gives Member States the possibility to take into consideration ethical aspects of GMOs in the decision-making. This article investigates the potential effects of such formulation by means of an empirical analysis of experiences gained the last years from similar Swedish regulations for GMOs, aiming at promoting sustainable development. The faulty implementation shown in the Swedish case indicates that legal stipulations for ethics as such have limited importance. It is suggested that public participation is an important factor for successful implementation of the ethics of sustainable development. KEY WORDS: environmental code, ethics, genetically modified, GMO, public participation, sustainable development. (JAEE)

Karlsson, Rasmus, "Reducing Asymmetries in Intergenerational Justice: Descent from Modernity or Space Industrialization?", Organization and Environment 19 (no. 2, June 2006): 233-50. Although contractual conceptions of intergenerational justice normally regard the responsibility held by each generation as symmetrical, this article argues that the late modern society has created an asymmetry between generations because of its unprecedented instrumental and destructive capacity. Extending one contractual device used by John Rawls in line with what Brian Barry has suggested, this article analyzes the roots of the asymmetry and presents two political strategies to end it. The first strategy resembles the traditional deep ecological program whereas the second holds an imaginative vision of a human future in

space. Both strategies seek to reduce the influence present generations exercise on the level of opportunity available to future generations, and the key normative argument is that intergenerational justice requires spatial and temporal limits on political action. Karlsson is a graduate student in political science at the University of Lund, Sweden.

Kasanmoentalib, Soemini. "Science and Values in Risk Assessment: The Case of Deliberate Release of Genetically Engineered Organisms," Journal of Agricultural and Environmental Ethics 9(1996):42-60. To make more responsible decisions regarding risk and to understand disagreements and controversies in risk assessments, it is important to know how and where values are infused into risk assessment and how they are embedded in the conclusions. In this article an attempt is made to disentangle the relationship of science and values in decision-making concerning the deliberate release of genetically modified organisms (GMOs) into the environment. This exercise in applied philosophy of science is based on Helen Longino's contextual empiricism which attempts to reconcile the "objectivity" of science with its social and cultural construction. Longino distinguishes different levels of research on which values

apparently contextual with respect to a given research program can shape the knowledge emerging from that program. Her scheme is applied for locating and identifying the values that affect environment risk assessments of the field experiments with GMOs. The article concludes with some provisional suggestions for the decision process and the role of scientists in it. Keywords: applied philosophy of science, science in policy, risk assessment, fact-value dichotomy, biotechnology, genetically modified organisms, deliberate release. Kasanmoentalib teaches biology at the Institute for Ethics Free University in Amsterdam. (JAEE)

Kassiola, Joel J., "Can Environmental Ethics 'Solve' Environmental Problems and Save the World? Yes, but First We Must Recognise the Essential Normative Nature of Environmental Problems," Environmental Values 12(2003): 489-514. What is the nature of environmental problems? This article attempts to illuminate this question by exploring the relationship between environmental ethics, environmental problems and their solution. It does this by examining and criticising the argument contained in a recent issue of Environmental Values asserting that environmental ethics does not have a role to play in solving environmental problems. The major point made in this rebuttal article is that

environmental problems are essentially normative in nature. Therefore, normative discourse, and environmental ethics in particular, do have a crucial role to play in environmental thought and action. The discussion concludes with the judgment that a failure to recognise this essential contribution of normative discourse to environmentalism by committing to a conservative empirical reductionism of environmental problems is detrimental to the necessary ethical and social change required to save the world. (EV)

Kassiola, Joel Jay, The Death of Industrial Civilization: The Limits to Economic Growth and the Repoliticization of an Advanced Industrial Society (Albany: State University of New York Press, 1990). \$ 19.95 paper; \$ 59.50 hardback. The contemporary ecological crisis within industrial society is caused by the values inherent in unlimited economic growth and competitive materialism. The limits-to-growth critique of industrial civilization is the most effective stance against an otherwise dominant and invincible social order. A prescription of the social changes that must be implemented to transform industrial society into a sustainable and more satisfying society. Kassiola is professor of political science at Brooklyn College. (v1,#3)

Kassiola, Joel Jay, ed., Explorations in Environmental Political Theory, Thinking About What We Value." Armonk: M.E. Sharpe, 2003. Essays by Kassiola, Milbraith, Pirages, Dobson, Paehle, McLaughlin, Goodin, and Zimmerman. Focuses on political and value issues that underlie the global environmental crisis. (Thanks to Andy McLaughlin.)

Kates, Carol A., "Reproductive Liberty and Overpopulation: Reply to Stanley Warner," Environmental Values 14(2005): 265-270. Reply to Stanley Warner's response in Environmental Values 13.3 to the article by Carol Kates in Environmental Values 13.1. Kates is in philosophy and religion, Ithaca College, Ithaca, NY. (EV)

Kates, Carol A., "Reproductive Liberty and Overpopulation," Environmental Values 13(2004):51-79. Despite substantial evidence pointing to a looming Malthusian catastrophe, governmental measures to reduce population have been opposed both by religious conservatives and by many liberals, especially liberal feminists. Liberal critics have claimed that 'utilitarian' population policies violate a 'fundamental right of reproductive liberty'. This essay argues that reproductive liberty should not be considered a fundamental human right, or certainly not an infeasible right. It should, instead, be strictly regulated by a global agreement designed to reduce population to a sustainable level. Three major points are discussed: 1) the current state of the overpopulation problem; 2) the claim of a fundamental human right of reproductive liberty; 3) an outline of a global agreement to address overpopulation as a 'tragedy of the commons'. Kates is in philosophy and religion, Ithaca College, Ithaca, NY. (EV)

Kates, Robert W., "Population And Consumption: What We Know, What We Need To Know," Environment 42 (No. 3, Apr 01 2000): 10- . Population is well understood and predictable. Consumption, however, is less studied and growing. Still, getting from more to enough is the key to a sustainable future. (v.11,#2)

Kates, Robert W., "Sustaining Life on Earth," Scientific American 271 (No. 4, October, 1993):114-122. In a special issue on "Life in the Universe," and after nine articles about how Earth originated, life on Earth originated, and human life on Earth originated, Scientific American wonders whether, now that technological humans are here, life can be sustained in the future. Through intelligence, human beings have become a natural force to be reckoned with. Each major technological revolution--toolmaking, agriculture, and manufacturing--has triggered geometric population growth. Can we learn enough about physical, biological, and social reality to fashion a future that our planet can sustain? Kates is a geographer formerly at Brown University. (v5,#3)

Katz, Eric, "Searching for Intrinsic Value: Pragmatism and Despair in Environmental Ethics," Environmental Ethics 9(1987):231-241. A criticism of an earlier paper by Anthony Weston (see Environmental Ethics 1985). Pragmatism is not an adequate basis for an environmental ethic because it is an anthropocentric, and, ultimately, a subjective system of values. (Katz, Bibl # 1)

Katz, Eric, "Defending the Use of Animals by Business: Animal Liberation and Environmental Ethics," in Hoffman, Frederick, and Petry, above. Katz argues "that the adoption by business of a more conscious environmentalism can serve as a defense against the animal liberation movement. This strategy may seem paradoxical: how can business defend its use of animals by advocating the protection of the environment? But the paradox disappears once we see that animal liberation and environmentalism are incompatible practical moral doctrines." "Business must stress that the primary value to be promoted in the human interaction with the animal kingdom is the natural fit with the ecological processes. ... As long

as animals are used in ways that respect their natural integrity or their natural functions in ecological systems, then they are being treated with the proper moral consideration. Human beings, as natural omnivores, are not acting directly against moral value when they raise and kill animals for food." Katz is professor of philosophy at the New Jersey Institute of Technology. (v2,#1)

Katz, Eric, and Lauren Oechsli. "Moving beyond Anthropocentrism: Environmental Ethics, Development, and the Amazon." Environmental Ethics 15(1993):49-59. We argue for the rejection of an anthropocentric and instrumental system of normative ethics. Moral arguments for the preservation of the environment cannot be based on the promotion of human interests or goods. The failure of anthropocentric arguments is exemplified by the dilemma of Third World development policy, e.g., the controversy over the preservation of the Amazon rain forest. Considerations of both utility and justice preclude a solution to the problems of Third World development from the restrictive framework of anthropocentric interests. A moral theory in which nature is considered to be morally considerable in itself can justify environmental policies of preservation, even in the Third World. Thus, a nonanthropocentric framework for environmental ethics should be adopted as the basis for policy decisions. Katz and Oechsli are at the Center of Technology Studies, New Jersey Institute of Technology, Newark, NJ. (EE)

Katz, Eric, "Artefacts and Functions: A Note on the Value of Nature." Environmental Values Vol.2 No.3(1993):223-232. ABSTRACT: This paper examines and compares the ontological and axiological character of artefacts--human creations--with nonhuman natural entities. The essential difference between artefacts and natural entities is that the former are always the result of human intention and design, while the latter are independent of human purpose. Artefacts have functions; natural entities do not. The connection to human intentional purpose implies a different kind of value for artefacts. Artefacts are evaluated solely by their instrumental (and anthropocentric) use, while natural entities can be appreciated for their independent and autonomous existence. This distinction has normative implications, especially for environmental policy and the development of an environmental ethic. Intervention in natural processes, even to 'improve' nature, must be limited, for human action changes natural entities and systems into artefacts. A moral imperative requires respect for the autonomy of nature and resistance to the human domination of nature. KEYWORDS: Ecological restoration, environmental sustainability, biological function, environmental ethics, natural value, artefacts, autonomy. Science, Technology, and Societies Program, Department of Social Sciences and Policy Studies, New Jersey Institute of Technology, Newark, New Jersey 07102, USA.

Katz, Eric, "Organism, Community, and the 'Substitution Problem'" Environmental Ethics 7(1985):241-256. An examination of two holistic models of the natural environment: organism and community. An organic conception of nature considers the parts of nature--individuals, species, ecosystems--to be instrumentally valuable. A community model is preferred, because it permits the possibility of the intrinsic value of the individual members of the holistic community. This essay is one of the few that examines crucial principles and distinctions within environmental holism. (Katz, Bibl # 1)

Katz, Eric, "Imperialism and Environmentalism," Social Theory and Practice 21 (no. 2, Summer 1995):271-285. Imperialism--power, force, and domination--as a model or metaphor for understanding the human relationship with nature. A metaphor of imperialism is rather different from the benign and optimistic metaphor of "the balance of nature." One purpose of this examination into the power of nature is to open a dialogue about the forms of rhetoric that help to determine environmental policy. Which metaphors of the human/nature relationship are more appropriate? Should we view nature as a complex of aggressive forces, or as a balanced system of cooperation and harmony? Why not use both metaphors? The metaphor we choose will have a fundamental impact on our ideas concerning the appropriate role of

human action in the natural world. Four possibilities are examined, especially the first three: (1) Imperialistic humans over other humans, and (2) over nature. (3) Imperialistic nature over humans, and (4) over other things in nature. Nature can be the "other" that is dominated by humanity, or it can be the (nonintentional) dominating and imperialistic force that subdues some aspect of humanity. Katz teaches philosophy and policy at the New Jersey Institute of Technology. (v6,#4)

Katz, Eric, Nature as Subject: Human Obligation and Natural Community. Lanham, MD: Rowman and Littlefield, 1997. The collected essays that Katz has written over twenty formative years of environmental philosophy. Sixteen essays. "My basic critical idea is that human-centered (or 'anthropocentric') ethical systems fail to account for a moral justification for the central policies of environmentalism. From this negative account of anthropocentrism, I derive my fundamental position in environmental ethics: the direct moral consideration and respect for the evolutionary processes of nature. I believe that it is a basic ethical principle that we must respect Nature as an ongoing subject of a history, a life-process, a developmental system. ... I consider Nature as analogous to a human subject, entitled to moral respect and subject to traditional ethical categories. I do not anthropomorphize Nature; I do not ascribe human feelings and intentions to the operations of natural processes. I do not consider natural processes to be sentient or alive. I merely place Nature within the realm of ethical activity. The basis of a moral justification of environmental policy is that we have ethical obligations to the natural world, just as we have ethical obligations to our fellow human beings" (p. xvi). Includes the essays in which Katz has been especially provocative, such as "The Big Lie" (restoration biology), "Imperialism and Environmentalism" (Nature as an imperialist), and continues such stimulating metaphors in the theme of "nature as (analogous to a human) subject". Also notable for essays on Judaism and environmentalism. Katz is in philosophy at the New Jersey Institute of Technology. (v7,#4)

Katz, Eric, Light, Andrew, and Rothenberg, David, eds., Beneath the Surface: Critical Essays in the Philosophy of Deep Ecology. Cambridge, MA: The MIT Press, 2000. Fourteen contributors. Focuses on deep ecology as a philosophy, not as a political, social, or environmental movement. Relations of deep ecology to social ecology, ecofeminism, and moral pluralism, continental philosophy, postmodernism, and non-Western philosophical traditions. The first anthology on deep ecology that is not primarily the work of the movements followers. Katz and Rothenberg are in philosophy at the New Jersey Institute of Technology. Light is in environmental philosophy at New York University. Contents:

--Clark, John, "How Wide is Deep Ecology?"

--Katz, Eric, "Against the Inevitability of Anthropocentrism"

--Grey, William, "A Critique of Deep Green Theory"

Katz, Eric. "Utilitarianism and Preservation." Environmental Ethics 1(1979):357-64. In "The Concept of the Irreplaceable," John N. Martin claims that utilitarian arguments can explain the environmentalist position concerning the preservation of natural objects as long as human attitudes toward preservation are considered along with the direct benefits of environmental preservation. But this type of utilitarian justification is biased in favor of the satisfaction of human preferences. No ethical theory which calculates goodness in terms of the amount of human satisfaction can present an adequate justification of environmental preservation. Since human interests must be considered primary, natural objects will only be preserved when their preservation is in accord with human preferences. Katz is in the department of Philosophy and Environmental Science, Barnard College. (EE)

Katz, Eric. Review of Environmental Justice. By Peter Wenz. Environmental Ethics 11(1989):269-75.

Katz, Eric. "Organism, Community, and the 'Substitution Problem.'" 7(1985):241-56. Holistic accounts of the natural environment in environmental ethics fail to stress the distinction between the concepts of community and organism. Aldo Leopold's "Land Ethic" adds to this confusion, for it can be interpreted as promoting either a community or an organic model of nature. The difference between the two concepts lies in the degree of autonomy possessed by constituent entities within the holistic system. Members within a community are autonomous, while the parts of an organism are not. Different moral conclusions and environmental policies may result from this theoretical distinction. Treating natural entities as parts of an organism downgrades their intrinsic value as individual natural beings, since the only relevant moral criterion in an organic environmental ethic is the instrumental value that each natural entity has for the system. This ethic allows instances of the "substitution problem"--the replacement of one entity in an ecosystem by another provided that the overall functioning of the system is not harmed. However, since substitution violates environmentalist principles, for example, calling for respect for the integrity of the entities in a natural system, an organic environmental ethic must be rejected. A community model focuses on both the functional value and the autonomous intrinsic value of natural entities in a system. A community environmental ethic thus avoids the substitution problem. Katz is in the department of Philosophy and Environmental Science at Barnard College. (EE)

Katz, Eric. "A Pragmatic Reconsideration of Anthropocentrism." Environmental Ethics 21(1999):377-390. For much of its brief history, the field of environmental ethics has been critical of anthropocentrism. I here undertake a pragmatic reconsideration of anthropocentrism. In the first part of this essay, I explain what a pragmatic reconsideration of anthropocentrism means. I differentiate two distinct pragmatic strategies, one substantive and one methodological, and I adopt methodological pragmatism as my guiding principle. In the second part of this essay, I examine a case study of environmental polic--the problem of beach replenishment on Fire Island, New Yor--as a pragmatic test of

anthropocentrism. I conclude that the debate between anthropocentrism and nonanthropocentrism needs to be expressed in non-absolutist terms, i.e., in a language that permits compromise, flexibility, and a pluralism of values. The choice between anthropocentrism and nonanthropocentrism as the basis of both environmental policy and environmental ethics is highly contextual and thus requires a subtle examination of the concrete policy situation. (EE)

Katz, Eric. "Searching for Intrinsic Value." Environmental Ethics 9(1987):231-41. Anthony Weston has criticized the place of "intrinsic value" in the development of an environmental ethic, and he has urged a "pragmatic shift" toward a plurality of values based on human desires and experiences. I argue that Weston is mistaken for two reasons: (1) his view of the methodology of environmental ethics is distorted: the intrinsic value of natural entities is not the ground of all moral obligations regarding the environment; and (2) his pragmatic theory of value is too anthropocentric and subjective for the development of a secure and reliable environmental ethic. The obligation to protect the natural environment should not be based on certain "correct" experiences of humans as they interact with wild nature. Katz is in the department of Philosophy and Environmental Science, Barnard College. (EE)

Katz, Eric. "The Call of the Wild." Environmental Ethics 14(1992):265-73. In this essay, I use encounters with the white-tailed deer of Fire Island to explore the "call of the wild"--the attraction to value that exists in a natural world outside of human control. Value exists in nature to the extent that it avoids modification by human technology. Technology "fixes" the natural world by improving it for human use or by restoring degraded ecosystems. Technology creates a "new world," an artifactual reality that is far removed from the "wildness" of nature. The technological "fix" of nature thus raises a moral issue: how is an artifact morally different from a natural and wild entity? Artifacts are human instruments; their value lies in their ability to meet human needs. Natural entities have no intrinsic functions; they were not created for any instrumental purpose. To attempt to manage natural entities is to deny their inherent autonomy: a form of domination. The moral claim of the wilderness is thus a claim against human technological domination. We have an obligation to struggle against this domination by preserving as much of the natural world as possible. Katz is at the Center of Technology Studies, New Jersey Institute of Technology, Newark, NJ. (EE)

and How?", Journal of Agricultural Ethics 1(1988):257-273. In addition to reviewing the arguments in favor of and against habitat preservation, this paper proposes some innovative institutions that can both satisfy developmental aspirations and account for the global benefits of habitat preservation. Katzman is in research economics at Oak Ridge National Laboratory, Tennessee. Cale is in natural sciences and mathematics at Indiana University of Pennsylvania, Indiana, PA.

Kauffman, Stuart A., The Origins of Order: Self-Organization and Selection in Evolution. New York: Oxford University Press, 1993. A summary is: "Antichaos and Adaptation," Scientific American 265(no. 2, August 1991):78-84. Since Darwin, biologists have seen natural selection as virtually the sole source of that order. But Darwin could not have suspected the existence of self-organization, a recently discovered, innate property of some complex systems. It is possible that biological order reflects in part a spontaneous order on which selection has acted. Selection has molded, but was not compelled to invent, the native coherence or ontogeny, or biological development. We may have begun to understand evolution as the marriage of selection and self-organization. Natural selection may drive ordered systems to the edge of chaos because that is where the greatest possibility for self-organization, and survival in changing environments, occurs. Kauffman is professor biochemistry and biophysics at the University of Pennsylvania School of Medicine. (v5,#4)

Kauffman, Stuart A. "Beyond Reductionism: Reinventing the Sacred." *Edge* (November 17, 2006). Edge is online at: <<http://www.edge.org>>. "National parks are valuable because life is valuable on its own, a wonder of emergence, evolution and creativity. Reality is truly stunning." Kauffman argues that scientists should reinvent the sacred as this stunning creativity, which theologians have called God. Kauffman is in biology and physics at the University of Calgary and is also at the Sante Fe Institute.

Kaufman, Frederik, "Callicott on Native American Attitudes," Environmental Ethics 18(1996):437-438. Callicott claims that Native Americans extend the idea of community to nature which they populate with other, nonhuman persons. But if so, this has nothing to do with Leopold's land ethics, which extends moral considerability to animals, plants, soils, waters, not other persons. (EE)

Kaufman, Frederik A., Foundations of Environmental Philosophy: A Text with Readings. New York: McGraw Hill, 2003. Combines an authored text with readings. Focus: "The central question in environmental ethics is this: Which things count morally?" Chapter 1. Case study of the banana industry, used as a springboard into moral philosophy and the relevance of utilitarianism, Kantianism, natural law, and virtue ethics to the environment. Chapter 2. Moral reasoning and argument identification and analysis. Chapters 3-10: Differing conceptions of our relation to the nonhuman world. Chapter 3: The Human-Nature Relation (Human Dominion over Nature; Endangered Species). Chapter 4. Intrinsic Value in Nature. Chapter 5. Animals. Chapter 6. Biocentrism. Chapter 7. Ecocentric Ethics. Chapter 8. A New Anthropocentrism. Chapter 9. Environmental Economics and Policy. Chapter 10: Thoreau, Deep Ecology, and Ecofeminism. Kaufman is in philosophy at Ithaca College, Ithaca, NY. (v.13,#4)

Kaufman, Frederik. "Machines, Sentience, and the Scope of Morality." Environmental Ethics 16(1994):57-70. Environmental philosophers are often concerned to show that non-sentient things, such as plants or ecosystems, have interests and therefore are appropriate objects of moral concern. They deny that mentality is a necessary condition for having interests. Yet they also deny that they are committed to recognizing interests in things like machines. I argue that either machines have interests (and hence moral standing) too or mentality is a necessary condition for inclusion within the purview of morality. I go on to argue that the aspect of mentality necessary for having interests is more complicated than mere sentience. Kaufman is in the department of Philosophy and Religion, Ithaca College, Ithaca, NY. (EE)

Kaufman, Gordon D., "Ecological Consciousness and the Symbol 'God'." Pages 72-95 in Deborah A. Brown, ed., Christianity in the 21st Century (New York: Crossroad Publishing Co., 2000). Understanding God in terms of the metaphor of serendipitous creativity manifesting itself in a variety of evolutionary and historical trajectories facilitates maintaining a decisive qualitative distinction (though not an ontological separation) between God and the created order. Conceiving humans as biohistorical beings makes it clear that we humans are indissolubly a part of the created order. In the picture sketched here, the too-easy-anthropocentrism of traditional Christian thinking is undercut. Kaufman is professor of divinity emeritus, Harvard Divinity School. (v.14, #4)

Kaufman, Gordon D., In Face of Mystery. Cambridge, MA: Harvard University Press, 1993. 528 pages. \$ 39.95. Reconstructing the order of human life within the ecological web. Theology is an imaginative construction, a symbolic world for ordering life. Kaufman suggest that since it has been constructed, so it can be reconstructed, and he proceeds to do so using a "bio-historical" interpretation of human life. His interpretation of human historical existence situates human beings, with their capacity for freedom and creativity, within the ecological web that sustains life. This involves reevaluating the concept of God and the symbol of Christ as a point of reference. Kaufman teaches theology at Harvard Divinity School. (v6,#4)

Kaufman, Gordon D., "The Theological Structure of Christian Faith and the Feasibility of a Global Ecological Ethic," Zygon 38(no. 1, 2003):147-161. Scientific evolutionary/ecological understandings of nature are the basis of realizing that we are in an ecological crisis. Western understandings of God are being re-formulated in these scientific terms. But for a global ethic, Asian religions have typically tried to retain more traditional, prescientific concepts. These will need also to be scientifically re-formulated before we reach a feasible global ethic. Some say that it is presumptuous for the West to impose their scientific views on the East. But without such transformations in religious traditions East and West, is the development of a truly global ecological ethic possible? Kaufman is emeritus professor of divinity, Harvard University Divinity School. (v 14, #3)

Kaufmann, Thomas DaCosta. The Mastery of Nature: Aspects of Art, Science, and Humanism in the Renaissance. Princeton University Press, 1993. 300 pages. \$39.95. Kawall, Jason, "Is (Merely) Stalking Sentient Animals Morally Wrong?" Journal of Applied Philosophy 17 (no. 2, 2000):195-204. Such activities as tracking, watching, and photographing animals are frequently presented as morally superior alternatives to hunting, but could they themselves be morally problematic? I argue that, despite certain differences from the stalking of humans, a strong case can be made for the prima facie wrongness of stalking sentient animals. The chief harm of stalking is the fear and altered patterns of behavior which it forces upon its victims. Similar harms arise for both human and non-human victims of stalking; thus I argue that stalking animals is a prima facie, but overridable wrong. Still, a significant disanalogy between stalking humans and stalking animals can be seen in cases in which the victim is unaware of being stalked. I argue that such stalking is generally acceptable with respect to animals, but morally wrong with respect to humans. More generally, it is much harder to justify the stalking of humans than the stalking of animals, given the greater human interest in privacy. Kawall is in

philosophy and religion at the University of Tennessee at Chattanooga. (v.11,#3)

Kawall, Jason, "Review of: Bryan Norton, Searching for Sustainability: Interdisciplinary Essays in the Philosophy of Conservation Biology," Conservation Biology 18(2004):589-590. (v. 15, # 3)

Kawall, Jason, "Inner Diversity: An Alternative Ecological Virtue Ethics," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001): 27-35. Kawall proposes a modified virtue ethics, grounded in an analogy between ecosystems and human personalities. He suggests that we understand ourselves as possessing changing systems of inter-related subpersonalities with different virtues, and view our characters as flexible and evolving. Kawall is in the Department of Philosophy and Religion, University of Tennessee at Chattanooga. (v.13,#2)

Kawall, Jason. "Reverence for Life as a Viable Environmental Virtue." Environmental Ethics 25(2003):339-358. There have been several recent defenses of biocentric individualism, the position that all living beings have at least some moral standing, simply insofar as they are alive. I develop a virtue-based version of biocentric individualism, focusing on a virtue of reverence for life. In so doing, I attempt to show that such a virtue-based approach allows us to avoid common objections to biocentric individualism, based on its supposed impracticability (or, on the other hand, its emptiness). (EE)

Kawall, Jason. "On Behalf of Biocentric Individualism: A Response to Victoria Davion." Environmental Ethics 30(2008):69-88. Victoria Davion in "Itch Scratching, Patio Building, and Pesky Flies: Biocentric Individualism Revisited" takes biocentric individualism to task, focusing in particular on my paper, "Reverence for Life as a Viable Environmental Virtue." Davion levels a wide-range of criticisms, and concludes that we humans would be better off putting biocentric individualism aside to focus on more important issues and positions. Worries raised by Davion can be defended by elaborating on the position laid out in the original paper, including a background normative theory appealing to hypothetical virtuous ideal observers, upon which the position is drawn. Many of her criticisms appear to arise out of misreading or ignoring what is explicitly argued. When these misconstruals are corrected, it becomes clear that there is still space for a viable virtue of reverence for life. (EE)

Kay, Charles E., "Aboriginal Overkill: The Role of Native Americans in Structuring Western Ecosystems." Human Nature 5(1994):359-398. Kay maintains that Native Americans historically kept the ecosystems of the (now) American landscape in a structure maximizing biodiversity. Forthcoming as a book from Oxford University Press. (v8,#2)

Kay, Charles E., "Yellowstone: Ecological Malpractice," special issue of PERC Reports (502 S. 19th Ave., Suite 211, Bozeman, MT 59718), vol. 15, no. 2, June 1995. The "natural regulation" of elk in Yellowstone National Park has disastrously failed. Overpopulating elk are destroying the park, adversely affecting not only vegetation, but bear, beaver, and other wildlife. "The simple truth is that ungulate populations will not internally self-regulate before having had a serious impact on vegetation. Elk and bison never historically overgrazed Yellowstone or other national parks because hunting by Native Americans kept ungulate numbers low, promoting biodiversity." Park officials have repeatedly biased research and suppressed this fact. Kay teaches political science, with training in wildlife biology, at Utah State University. This study is forthcoming as a book. (v8,#2)

Kay, Jeanne, "Concepts of Nature in the Hebrew Bible," Environmental Ethics 10(1988):309-327. A detailed introduction to the complex array of ideas of nature in the Old Testament. Kay argues that the controversy generated by Lynn White, Jr. between models of stewardship and domination is overly simplistic. The Bible must be understood as a literary text rooted in a specific historical and ecological system. This perspective reveals the importance of the environment as an element in divine reward and punishment: environmental destruction results from human disobedience to the commandments. Outside of its specific historical/ecological context, debates over the meaning of the Bible for environmental policies becomes largely irrelevant. Kay presents an anthropocentric vision of the Old Testament and the role of God and nature in human life. (Katz, Bibl # 2)

Kay, Jeanne. "Comments on 'The Unnatural Jew.'" Environmental Ethics 7(1985):189-91. (EE)

Kay, Jeanne. "Concepts of Nature in the Hebrew Bible." Environmental Ethics 10(1988):309-27. The lack of resolution in the debate about the Bible's environmental despotism or stewardship may be resolved by more literal and literary approaches. When the Bible is examined in its own terms, rather than in those of current environmentalism, the Bible's own perspectives on nature and human ecology emerge. The Hebrew Bible's principal environmental theme is of nature's assistance in divine retribution. The Bible's frequent deployment of contradiction as a literary device, however, tempers this perspective to present a moral, yet multi-sided view of nature. Kay is in the department of Geography, University of Utah, Salt Lake City, UT. (EE)

Kealey, Daniel A., Revisioning Environmental Ethics. Albany: SUNY Press, 1990. Pp. xiii, 136. This short book is another contribution to a growing literature analyzing the "world-view" that has caused the environmental crisis. Kealey uses the psychohistorical concepts of Jean Gebser---the archaic, magical, mythic, and mental---as a "hermeneutical tool" for the analysis of various strands of environmental philosophy. He argues for an "integral" ecological ethic combining aspects of neoplatonism, Asian philosophy, and personalism. (Katz, Bibl # 2)

Kealey, Daniel H. Revisioning Environmental Ethics. Chapter titles: Environmental Ethics and Psychohistory; Mental and Magical Environmental Ethics; Mythic and Integral Environmental Ethics, Plotinus on Nature and Contemplation and the One; All Life is Yoga; Towards an Integral Ecological Ethic. Drawing on Plotinus, Aurobindo, and Max Scheler, Kealey outlines an adequate ecological ethic. Kealey is assistant professor in the department of philosophy and religion at Towson State University. 131 pages. State University of New York Press, 1990. \$ 44.50 hardback, \$ 14.95 paper. (v1,#2)

Kearns, Laurel Diane. Saving the Creation: Religious Environmentalism. Ph. D. Dissertation, Emory University, 1994. 365 pages. Recently there has been much activity from denominations, grassroots groups, and theologians articulating Christian responses to the ecological crisis. This study is not an analysis of academy-produced theological responses per se, but rather of the theologies held by those who see themselves "converting the pews." Drawing upon both theology and the sociology of religion to categorize these responses, there are three main religious-environmental "ethics" emerging in the United States: the "stewardship" ethic, the "eco-justice" ethic, and the "creation spirituality" ethic. Analysis of Lynn White's thesis and the development of ideas regarding nature from the Bible through American religious history. A sociological account of the environmental movement and American religion beginning in the sixties, with a focus on the creation spirituality of Matthew Fox and Thomas Berry and the stewardship theology of evangelicals such as Cal DeWitt and the North American Conference on Christianity and Ecology (NACCE). These two theologies clashed in the first attempt at forming a national eco-theological organization (NACCE), resulting in a splinter organization--the North American Conference on Religion and Ecology (NACRE). But these two ethics have much in common. Both are articulated primarily by similar organizations located outside of official denominations. They are also similar in their reliance on the natural sciences to support and inform their sacred vision. In an effort to re-enchant the world, they have similar emphases on a more holistic understanding of humans place in "creation". Yet their basic theological assumptions are quite different. The adviser was Nancy Tatom Ammerman. (v.11,#1)

Kearns, Laurel D. "Noah's Ark Goes to Washington: A Profile of Evangelical Environmentalism." Social Compass 44 (1997): 349-66. (v.11,#1)

Kearns, Laurel, "Saving the Creation: Christian Environmentalism in the United States," Sociology of Religion 57(no. 1, 1996):55-70. In the mid 1980's, religious environmental activism in the United States increased dramatically. Based on field study of this emerging movement, Kearns proposes three models or ethics of Christian-related eco-theology: Christian stewardship, eco-justice, and creation spirituality. As a portrait of the boundaries of this movement, Kearns focuses in detail on Christian stewardship and creation spirituality. She then examines religious environmentalism through the cultural shift/change frameworks of W. G. McLoughlin, Ann Swidler, Ronald Inglehart, James Beckford, and Roland Robertson (analysts of social change, especially of meaning shifts). Of particular interest is the synoptic, holistic, global perspective transcending the privatized self and the individual state, also the non-doctrinal character of the religious consciousness. With a bibliography. Worth reading. Kearns is at The Theological School, Drew University, Madison, NJ. (v8,#2)

Keat, Russell, "Citizens, Consumers, and the Environment: Reflections on The Economy of the Earth." Environmental Values 3(1994):333-349. This paper presents a critical evaluation of Mark Sagoff's critique of economic approaches to environmental decision-making in The Economy of the Earth. Whilst endorsing many of Sagoff's specific arguments against the use of extended versions of cost-benefit analysis in making such decisions, it criticizes the conceptual framework within which these arguments are developed. In particular, it suggests that what Sagoff represents as a tension between consumers and their public roles as citizens is better understood as one between culturally shared values concerning both the protection of nature and the pursuit of consumption; and that this conflict has itself to be resolved by them as citizens. KEYWORDS: Citizens, consumers, environment, Sagoff. Keat is in the Department of Politics, University of Edinburgh, U.K. (EV)

Keeling, Paul M., “Does the Idea of Wilderness Need a Defence?” *Environmental Values* 17(2008):505-519. The received wilderness idea of nature as untrammelled by human beings has been accused of assuming an untenable human/nature dualism which denies the Darwinian fact that humans are a part of nature. But the meaning of terms like 'nature' and 'natural' depends on the context of use and the contrast class implied in that context. When philosophers such as J. Baird Callicott and Steven Vogel insist that the only correct view is that humans are a part of nature, they ignore the perfectly ordinary context in which 'nature' is used to mean 'other than human'. What is at issue here are a priori grammatical rules which stand in no need of empirical justification. There is no incompatibility between the view that humans are a part of nature and the idea that nature is valuable because of its non-human origin. The essentialism about the word 'nature' endemic to this debate distracts from the real issue, which is the value of nature's wildness.

Keen, David, "Creation Spirituality and the Environment Debate," Ecotheology Vol 7 (No. 1 July

2002):10-29. Matthew Fox's Original Blessing, published in 1983, remains one of the best selling books in the field of Christian environmentalism. In it, Fox expounds his 'Creation Spirituality' as a solution to the global environmental crisis, along with several other major world issues of the late 20th century. Fox's work (over 20 books, and countless tapes, videos and lecture tours) is devoured at a popular level, but routinely dismissed by many 'green' theologians. This paper seeks to evaluate Creation Spirituality as an environmental theology.

Keen, David. "The Benefits of Famine: A Case Study of the Sudan." The Ecologist (1979) 25(no.6, Nov.1995):214. Discussions of famine relief--and the development process in general--tend to assume that the policies of national and international agencies alike reflect benevolent aims. The possibility that politically powerful groups may actively promote famine, or obstruct relief, for rational purposes of their own is rarely considered or addressed. (v7,#1)

Boyce, "Greater Yellowstone's Future: Ecosystem Management in a Wilderness Environment"; Joseph L. Sax, "Ecosystems and Property Rights in Greater Yellowstone: The Legal System in Transition." "Yellowstone is the symbol of modern society's commitment to preserving the vestiges of its wilderness heritage." "There simply is no alternative but to collaborate in defining an ecosystem-management ethic" (Preface). Keiter is in the College of Law and Boyce in the Department of Zoology, University of Wyoming, Laramie. (v3,#4)

Keith, David W., "The Earth is not yet an Artifact," IEEE Technology and Society Magazine 19(no. 4, 2000):25-28. Replying to the claim made by Brad Allenby that "the earth has become a human artifact." Earth's systems have indeed been much modified by human actions, but some more, some less. Affecting an ecosystem does not make an artifact of it; intentional management is required to make an artifact. We still need to think of fitting our agricultural and industrial processes in with earth's ecosystems, not of actively managing the whole planet. "We would be wise to walk before we try to run, to learn to mitigate before we try to manage" (p. 28). Keith is in engineering and public policy, Carnegie Mellon University, Pittsburgh.

Kelbessa, Workineh, Indigenous and Modern Environmental Ethics: A Study of the Indigenous Oromo Environmental Ethic and Oromo Environmental Ethics in the Light of Modern Issues of Environment and Development. PhD. dissertation, University of Wales, Cardiff, Fall 2001. Explores the linkage between indigenous and modern environmental ethics by examining the indigenous Oromo environmental ethic. The Oromo are a minority, traditionally pastoralist people in South-West Ethiopia, comprising some 30% of the entire Ethiopian population. This undercuts some modern arguments about what counts as authority, who counts as an expert, and who counts as a scientist. The Oromo people have developed complex systems of agriculture and intensive soil, water, vegetation and wildlife management that have survived the test of time and the vagaries of the environment. These practices incorporate Oromo values and beliefs more than Western practices incorporate Western traditional values.

Further, the Oromo world view can serve as the basis for a contemporary environmental ethic. Unlike anthropocentrists the Oromo have deep concerns for the future and health of both humans and nonhuman creatures. But indigenous and modern knowledge are not mutually exclusive. Each has limitations and neither can be a panacea for all ills in isolation. Both have something to teach as well as something to learn. In some instances one is superior to the other.

Conventional intellectual property rights should be revised to include local knowledge entitlements. The privatisation of environmental resources will aggravate the gap between the rich and the poor, both within and between nations. Power relations at local and international levels should be changed in the direction of just and environmentally and socially sound development. The thesis advisor was Robin Attfield. Kelbessa is in philosophy, Addis Ababa University, Addis Ababa, Ethiopia. (v.13,#1)

Kelbessa, Workineh, Traditional Oromo Attitudes towards the Environment: An Argument for Environmentally Sound Development. Addis Ababa, Ethiopia: Organization for Social Science Research in Eastern and Southern Africa, Social Science Research Report Series No. 19. ISSN 1608-6287. The Oromo are a people in Ethiopia. The environment is their constant concern, and they have accumulated practical knowledge through their experience and productive activity. They have complex systems of agriculture and intensive soil, water, vegetation and wildlife management that have survived the test of time and the vagaries of environmental change. Although this knowledge has limitations, there can be a productive dialogue between the Oromo and modern scientific and Western knowledge about environmental conservation. Peasants and modern environmental scientists and technicians can learn

from one another. Kelbessa is in philosophy, University of Addis Ababa, Ethiopia. (v.14, #4)

"The world view of many African societies has included an environmental ethic that can serve as the basis for modern environmental ethics" (p. 47). (v.14, #4)

Kelbessa, Workineh, "Globalization and Indigenous Environmental Knowledge in Ethiopia," in Taye Assefa, Severine M. Rugumamu, and Abdel Ghaffar M. Ahmed, eds., Globalization, Democracy and Development in Africa (Addis Ababa, Ethiopia: Organization for Social Science Research in Eastern and Southern Africa, 2001. ISBN 0 9521269 4 X. Kelbessa is in philosophy, University of Addis Ababa, Ethiopia. (v.14, #4)

Kelbessa, Workineh, "Environmental Ethics in Theory and Practical Application," Ethiopian Journal of the Social Sciences and Humanities, vol. 1, no. 1, December 2003, pages 63-88. Some of the key positions in environmental ethics presented for Ethiopian readers. Despite the misgivings of some, environmental ethics has much to contribute to the solution of global environmental problems. Examples are the precautionary principle, concerns for environmental justice, and concerns for nonhuman species. Environmental ethics could have a paramount role in creating concern about the actions of transnational corporations, irresponsibly capitalist countries and local industries that damage the environment. Environmental ethics can also alert peasant farmers, pastoralists and other indigenous peoples to understand the long-range effects of environmental degradation that are beyond the purview of local farmers. Farmers and pastoralists, however, often have local and multi-dimensional knowledge of their environments. "What must be clear is that environmental questions are not simply ethical. Environmental and development issues involve more than moral persuasion. They cannot be addressed without taking political power into account." (p. 81) Kelbessa is in philosophy, Addis Ababa University, Ethiopia, and completed his Ph.D. several years ago under Robin Attfield, University of Wales. (v.14, #4)

Kelbessa, Workineh. "Oral Traditions, African Philosophical Methods, and Their Contributions to Education and Our Global Knowledge." *Educations and their Purposes: A Conversation among Cultures* edited by Roger T. Ames and Peter D. Herschok. Honolulu: University of Hawaii Press and East-West Philosophers Conference, 2008. From the article: "This essay examines the nature and role of oral traditions in education and our global knowledge by taking the Oromo oral traditions as an example—the Oromo being the largest ethnic group in Ethiopia. The very existence of African philosophy is sometimes denied, owing to the lack of a written philosophical tradition, and the failure of oral narratives and performances to sustain analytical and rigorous philosophical dialogue. However such claims concerning philosophy were often based on a misunderstanding of orality. I will argue that oral tradition is a viable source of philosophical ideas and education. This is often expressed in proverbs. This includes highly developed environmental knowledge." Kelbessa is in philosophy at the University of Addis Ababa in Ethiopia.

Kelbessa, Workineh. "The Rehabilitation of Indigenous Environmental Ethics in Africa." *Diogenes* Vol. 52, no. 3 (2005): 17-34. From the article: "This article examines the rehabilitation of an indigenous environmental ethic and indigenous environmental ethics in Africa. It seeks to provide an understanding of how the many culture-specific African societies view their relationship to the natural world. It aims to contribute to the articulation of environmental ethics grounded in indigenous traditions and inspired by broad ecological perspectives. The article begins with a survey of modern environmental ethics. It will then examine indigenous attitudes toward nature in Africa by focusing on the environmental ethics of the Oromo of Ethiopia. The Oromo constitute the largest ethnic group in Ethiopia. The last part provides a general conclusion."

Keller, David, "Gleaning Lessons From Deep Ecology," Ethics and the Environment 2(1997):139-148. By reflecting on Deep Ecology, several lessons can be culled for environmental philosophy in general. The Deep Ecology of Arne Naess, Bill Devall, and George Sessions is appropriately characterized as a theory founded on the principles of biocentric egalitarianism and metaphysical holism. After considering each of these principles in turn, and then in relation to each other, the lesson turns out to be that the ontological foundation for environmental ethics must be nonegalitarian and polycentric. Keller is in philosophy at Utah Valley State College in Orem. (E&E)

Keller, EF, "Ecosystems, Organisms, and Machines," BioScience 55 (no. 12, December 2005): 1069-1074. My theme is the concept, and the term, "self organization." The history of this term, originally introduced by Immanuel Kant to characterize the unique properties of living organisms, is inseparable from the history of biology. Only in the second half of the 20th century does it begin to acquire the promise of a physicalistic understanding. This it does with two critical transformations in the meaning of the term: first, with the advent of cybernetics and its dissolution of the boundary between organisms and machines, and second, with the mathematical triumphs of nonlinear dynamical systems theory and claims to having dissolved the boundary between organisms and such physical phenomena as thunderstorms. I explore the applicability of self organization to the ecosystem—a hybrid entity that is part organism, part machine, and perhaps even part thunderstorm.

Kellert, Stephen R. and Edward O. Wilson, eds., The Biophilia Hypothesis. Washington, DC: Island Press, Shearwater Books, 1993. Biophilia is E. O. Wilson's term for an innate human affinity for the natural world. People are disposed to like certain kind of environments. Experience with natural life and the life processes is a biologically based need, integral to our development as individuals. There is also, perhaps, some biophobia, innate fear of nature, for example of snakes and spiders. Biological conservation can, in part at least, be built on these innate, genetic dispositions. We need to save nature for our own well-being. Sixteen contributors. The philosophical contribution is by Holmes Rolston, who asks whether Wilson's ideas about biophilia are compatible with his ideas about selfish genes. Kellert is in forestry at Yale University, Wilson is a zoologist at Harvard University. (v4,#2)

Kellert, Stephen, Building for Life: Designing and Understanding the Human-Nature Connection. Washington: Island Press, 2005. Sustainable and restorative design will minimize adverse impacts on the natural environment and also will enhance human health and well being by fostering positive contact between people and nature in the built environment. Interaction with nature is critically important to human well-being and development. But contemporary society has become confused about the role of the natural environment in human physical and mental lives and has tended to impoverish this connection especially in the urban built environment. The scale and character of the modern environment has compromised and diminished the relation between people and the natural world. This is more of a design failure than an intrinsic flaw of contemporary life. Kellert is in social ecology at Yale School of Forestry and Environmental Studies.

Kelley, Kevin W., ed., The Home Planet Reading, MA: Addison-Wesley, 1988. Also published in Moscow: MIR Publishers. An extraordinary book of photographs of Earth from space, with reflections from the hundred or so men and women from thirteen countries who have flown into Earth orbit or to the lunar surface. Edited for the Association of Space Explorers, this large volume conveys the dazzling and profound existential and visual impact of seeing our planet from space. With the Soviets and others alike,

the experiences are often religious in the broad sense of that term, a sense of being grasped by an unexpected encounter with this mysterious and ineffable planet. The perception of vulnerability, combined with wonder and adoration, give rise to a resolve to protect the planet against onslaughts by the human species. For a perceptive review see, James Huchingson, "Earthstruck," Zygon, September 1990. (v1,#3)

Kelsey, Elin, "Integrating Multiple Knowledge Systems into Environmental Decision-making: Two Case Studies of Participatory Biodiversity Initiatives in Canada and their Implications for Conceptions of Education and Public Involvement," Environmental Values 12(2003): 381-396. Biodiversity initiatives have traditionally operated within a 'science-first' model of environmental decision-making. The model assumes a hierarchical relationship in which scientific knowledge is elevated above other knowledge systems. Consequently, other types of knowledge held by the public, such as traditional or lay knowledges, are undervalued and under-represented in biodiversity projects. Drawing upon two case studies of biodiversity initiatives in Canada, this paper looks at the role that constructivist conceptions of education play in the integration of alternative knowledge systems in environmental decision-making. In so doing, it argues that the conservation, sustainable use and equitable sharing goals outlined by the Convention on Biological Diversity (signed in 1992 under the auspices of the United Nations Environmental Programme) demand new models of governance which embrace the adaptive management qualities of learning organisations. Kempton, Willet M., James S. Boster, and Jennifer A. Hartley, Environmental Values in American Culture. Cambridge, MA: MIT Press, 1995. 320 pages. \$ 39.95. Fundamental environmental beliefs and value are not restricted to those who are white, liberal, educated, and wealthy, but are held by many Americans in various socioeconomic groups, so widely held as to constitute "an American paradigm." A six year study sponsored by the National Science Foundation and conducted by a team of cultural anthropologists. Some surprising results: with a question such as "Justice is not just for human beings. We need to be as fair to plants and animals as we are towards people," 97 percent of Earth First types agreed, but so did 63 percent of sawmill workers from the Pacific Northwest. "Our obligation to preserve nature isn't just a responsibility to other people but to the environment itself," 97 percent of Earth First agreed, and 82 percent of sawmill workers (p. 113). The study concentrated on the lay public and avoided political, financial, and industrial "elites." The researchers especially conclude that environmentalists are missing an opportunity by depending heavily on utilitarian arguments and neglecting traditional religious teaching and biocentrism, which they identify as the belief that nonhumans

have rights and values too. "An environmental view of the world is more universal than previous studies have suggested" (p. ix). (v7,#1)

Kennedy, Greg. *An Ontology of Trash: The Disposable and Its Problematic Nature*. Albany: State University of New York Press, 2007. Kennedy presents a philosophical exploration of the problematic nature of the disposable by understanding trash as an ontological problem that is a result of our unsettled relation to nature. He argues that our metaphysical drive from immanence to transcendence leaves us in an alien world of objects drained of a meaningful physical presence, and consequently we interpret these objects as lacking essential meaning that exist only to disappear as trash.

Kennedy, James J., and Niels Elers Koch, "Viewing and Managing Natural Resources as Human-Ecosystem Relationships," Forest Policy and Economics 6(2004):497-504. The increasing diversity, complexity and dynamics of ecosystem values and uses over the last 50 years requires new ways for natural resource managers (foresters, wildlife biologists, etc) to understand and relate to their professional roles and responsibilities. Three stages in Western-world natural resources management are identified: (1) Traditional stage, natural resources, first, foremost and forever, to (2) Transitional stage, natural resource management, for better or worse, involves people, to (3) Relationship stage: managing natural resources for valued people and ecosystem relationships. Kennedy is in Environmental Science, Wageningen University, Netherlands and Utah State University. Koch is at the Danish Forest and Landscape Research Institute, Hoersholm, Denmark.

Kennedy, John S., The New Anthropomorphism. Cambridge and New York: Cambridge University Press, 1992. 208 pages. Paper, \$ 17.95. Anthropomorphism still lurks under different disguises; scientists constantly slip into anthropomorphism in researching and interpreting animal behavior. Some examples, now rather well exposed, are "search image," "trail-following," and "grammatical language."

Others, not yet realized to be erroneous, are "goal-directedness, self-awareness, cognition, and suffering." Kennedy was formerly at the University of London. (v4,#2)

Kenworthy, Tom, "Fish Hatcheries Caught Between the Wisdom and the Politics of Stocking," Washington Post (12/1/96): A3. Fish hatcheries do more harm than good? With the notable exception of Montana--which stopped stocking its streams and rivers in the 1970s--most western states are heavily dependent on fish hatcheries to supply fish for an economically and politically powerful sport fishing industry. But a growing body of evidence suggests that fish hatcheries may do more harm than good. Reliance on catchable trout production often leads to a loss of genetic diversity and the spread of disease. Whirling disease, first discovered in Colorado in 1987, is now found in many of the state's premier trout rivers and in about 1/2 of the state's hatcheries. One study suggests that hatchery fish were contributing to a decline in the Northwest's troubled wild-salmon stocks. Critics favor shifting from producing fish for recreation to protecting fish habitat and declining species. They think building more and more hatcheries is not likely to make up for ecological damage caused by dams, timber cutting, industrial pollution, and other destructions of fish habitat. (v8,#2)

Kenworthy, Tom, "Wolf Reintroduction Program is Illegal," Washington Post (12/13/97): A2
Robbins, Jim, "In 2 Years, Wolves Reshaped Yellowstone," New York Times (12/30/97): F1. Restoration of Yellowstone Wolves Ruled Illegal. A federal judge has ruled that the restoration of 150 wolves to Yellowstone and central Idaho was illegal. The introduced wolves were designated an "experimental, nonessential population" which allows the U.S. Fish and Wildlife Service (and ranchers) more control over "problem" wolves. Wolves who migrated on their own into these areas and mingled with the restored wolves were to be treated under this experimental designation as well. The judge ruled that it violated the Endangered Species Act to provide these naturally-occurring wolves with less than full protection. The suit had been brought not only by ranchers opposing wolf restoration, but by some environmental groups who wanted the wolves to have full protection under the Act. Some fear that the judge's order to remove the wolves, if upheld, will result in the federal government killing the animals because recapturing the packs would be exceedingly difficult. The judge's decision has been appealed. The restored wolves have had a significant impact in Yellowstone, killing half the coyotes in the Park, which in turn has made rodents more plentiful, leading to a increase in hawks and eagles. The wolves have also become a major Park attraction. (v.8,#4)

Kerasote, Ted, "What We Talk About When We Talk About Wilderness," Sports Afield, August 1998, pp. 68-73. "The essential ingredient is big, dangerous animals that can kill you." Well, that's the talk of the macho types anyway; ecofeminists might talk about something else. The macho talk at least sells outdoor sports magazines.

Kernohan, Andrew. "Rights against Polluters." Environmental Ethics 17(1995):245-257. When there is only one source of pollution, the language of rights is adequate for justifying solutions to pollution problems. However, pollution is often both a public and an accumulative harm. According to Feinberg, an accumulative harm is a harm to some person brought about by the actions of many people when the action of no single person is sufficient, by itself, to cause the harm. For example, although no single car emits enough exhaust to do any harm, the emissions from many cars can accumulate to an unhealthy level. In this paper, I argue that rights, understood in terms of the will theory of Hart and the interest theories of Lyons and Raz, cannot justify protecting people from public, accumulative harms. I conclude that pollution regulation should focus not on protecting people's rights, but on preventing harm to people's interests. Kernohan is in the department of philosophy, Dalhousie University, Halifax. (EE)

Kerr, Alexander M., and Andrew H. Baird. "Natural Barriers to Natural Disasters." *BioScience* Vol. 57, no. 2 (2007): 102-3.

Kerr, Andrew J. "The Possibility of Metaphysics: Environmental Ethics and the Naturalistic Fallacy." Environmental Ethics 22(2000):85-99. One of the most distinguishing features of environmental ethics

has been the effort to develop a nonanthropocentric intrinsic value theory, that is, a definition of the good which is not dependent upon some quality particular to humanity, a definition of the good whereby properties found in the terrestrial, nonhuman world are constitutive of that definition. In this paper, I argue that major nonanthropocentric theories suffer from arbitrariness. I argue through the use of representative thinkers that much nonanthropocentric theory has committed the naturalistic fallacy because it has deployed various forms of empirical naturalism, and that to meet this challenge nonanthropocentrism must employ a form of metaphysically based nonanthropocentrism. I do not argue that the naturalistic fallacy is valid. Rather, I show that a sample of major thinkers, representative of a logically exhaustive set of possible evasions of the naturalistic fallacy, all fail to evade the fallacy. Further, I show that the failure of this set of possible evasions leaves but one evasion possible, namely, ethical theory grounded in metaphysics. Finally, I recommend "process" metaphysics as the most promising metaphysical ground for environmental ethics, assuming the validity of the naturalistic fallacy. (EE)

Kerr, Andy, "Big Wild: A Legislative Vehicle for Conserving and Restoring Wildlands in the United States," Wild Earth 9 (No. 4, Wint 1999): 77- .

Kerr, Richard A., "Big El Niños Ride the Back of Slower Climate Change," Science 283(1999):1108-1109. After two El Niños of the century in fifteen years, climate researchers are finding explanations in long-term climate change. Global warming seems to intensify the El Niños. (v.10,#1)

Kerr, Richard A., "Three Degrees of Consensus," Science 305(13 August, 2004):932-934. Climate researchers are finally homing in on just how bad greenhouse warming could get--and it seems increasingly unlikely that we will escape with a mild warning. Almost all the evidence points to 3 degrees centigrade as the most likely amount, by present projections. (v. 15, # 3)

Kerr, Richard A., "The Next Oil Crisis Looms Large--and Perhaps Close," Science 281(1998):1128-1131. Many economists foresee another half century of cheap oil, but a growing contingent of geologists warns that oil will begin to run out much sooner--perhaps in only ten years. Everyone agrees that the fossil fuel accumulated over half a billion years will be all consumed in a two century binge of profligate energy use. (v.9,#3)

Kerr, Richard A., "Acid Rain Control: Success on the Cheap," Science 282(1998):1024-1027. The free-market approach has curbed acid rain beyond expectations and far cheaper than predicted. At many plants, sulphur dioxide emissions have already dropped beyond those required by law. The cost estimates are about \$ 1 billion a year, dramatically lower than earlier forecasts of \$ 10 billion. Multiple factors are involved, with economists still asking why, but one factor has been the flexibility in the emissions trading system (the so-called "rights to pollute"). A new round of reductions is forthcoming. Can anything like this work for reducing global carbon dioxide emissions? (v.9,#4)

Kerr, Richard A., "Life Goes to Extremes in the Deep Earth--and Elsewhere?" Science 276(1997):704-704. Life has been discovered up to 2.8 kilometers under the surface of the earth (in Virginia), as well as half a kilometer beneath the deep ocean floor, the latter associated with hydrothermal vents. It has also been found 1.5 kilometers below the Columbia Plateau in bare salt rock. This leads to much speculation about extensive underground life, largely microbial. In underground life, metabolism may be quite slow, and nutrients quite scarce. (v8,#2)

Kerr, Richard A., "Requiem for Life on Mars? Support for Microbes Fades," Science 282(1998):1398-1400. Few now think that the Martian meteorite from Antarctica contains any evidence of life on Mars, despite the startling announcement two years ago. NASA has spent \$2.3 million to decide not so. One main reason is that the alleged microbes are far too small to have ever been alive (See Vogel, Gretchen, "Finding Life's Limits," Science 282(1998):1399). (v.9,#4)

Kerr, Richard A. "Pushing the Scary Side of Global Warming." *Science* Vol. 316, no. 5830 (8 June 2007): 1412-15. Greenhouse warming might be more disastrous than the recent international assessment managed to convey, scientists are realizing. But how can they get the word out without seeming alarmist?

Kerr, Richard A. "Global Warming is Changing the World." *Science* Vol. 316, no. 5822 (13 April 2007): 188-90. Another Intergovernmental Panel on Climate Change (IPCC) declares in no uncertain terms that the world is warming and that humans are mostly to blame. Humans are altering their world and the life in it by altering climate. Looking ahead, global warming's impacts will only worsen.

Kerr, Richard A. "Mammoth-Killer Impact Gets Mixed Reception from Scientists." *Science* Vol. 316, no. 5829 (1 June 2007): 1264-65. Some scientists claim that an exploding comet wreaked havoc on both humans and animals, including mammoths, some 13,000 years ago. But other scientists are unconvinced by the evidence. Kerr's article is another in a series of "impact wars," controversies over whether and how far extinctions and other disruptions on Earth can be attributed to extraterrestrial causes.

Kerr, Richard A. "Record U.S. Warmth of 2006 Was Part Natural, Part Greenhouse." *Science* Vol. 317, no. 5835 (13 July 2007): 182-83. According to National Oceanic and Atmospheric Administration (NOAA) scientists, anthropogenic greenhouse warming was behind more than half of 2006's record-breaking heat. The year 2006 was the warmest year for the lower 48 U.S. states since record-keeping began in 1895.

Kerridge, Richard, and Sammells, eds., Writing the Environment: Ecocriticism and Literature. London: Zed Books, 1998.

Kerridge, Richard and Neil Sammells, eds. Writing the Environment: Ecocriticism and Literature. Atlantic Highlands, NJ: Humanities Press, Zed Books, 1996. The rich variety of environmentalist positions--from ecofeminism to deep ecology--and theories about their contribution to critical theory, literature and popular culture. Contributors explore a wide variety of issues including sexual politics and nature, the link between environmental and cultural degradation, the influence of Heidegger on environmentalism and the degree of continuity between poststructuralist theory and ecological perspectives. (v7,#1)

Kerry, John, and Teresa Heinz Kerry. *This Moment on Earth: Today's New Environmentalists and Their Vision for the Future*. New York: Perseus Group, Public Affairs Books, 2007. This is a call to environmentalism by the former Democratic presidential candidate and his wife. The environment, and the movement that grew up to protect it, is under attack concerted and purposeful. Yet the need for solutions to pressing environmental problems grows more urgent each day. These issues unite people across party and ideological lines. From the San Juan Basin to the Gulf of Mexico to the South Bronx, from mothers on Cape Cod to Colorado ranchers, the Kerrys find a vibrant coalition of people and communities deploying ingenuity, technology, and sheer will power to save the world they know and love. They focus on these new environmental pioneers.

Kershaw, Baz. *Theatre Ecology: Environments and Performance Events*. Cambridge: Cambridge University Press, 2008. Kershaw explores questions such as: What are the challenges to theatre and the purposes of performance in an ecologically threatened world? Is there a future for theatre as an ethically and politically alert art through environmental action? How might ecological understandings refigure the natural virtues of theatre and performance?

Kershaw, Sarah, "A Right to Hunt, Fish and Trick Bears," New York Times, November 7, 2004, section 4, page 2. In Alaska and Maine voters rejected ballot measures that would have banned bear-hunting by

bait and dogs. Louisiana, the "sportsman's paradise," overwhelmingly approved to make "the freedom to hunt, fish and trap" a state constitutional right, also affirming that this is a "valued natural heritage that shall be forever preserved for the people." Similar amendments to constitutions are pending in several other states--driven by fears that animal rights activists will ban hunting. (v.14, #4)

Keulartz, Jozef, Henny van der Windt, and Jacques Swart, "Concepts of Nature as Communicative Devices: The Case of Dutch Nature Policy," Environmental Values 13(2004):81-99. The recent widespread shift in governance from the state to the market and to civil society, in combination with the simultaneous shift from the national level to supra-national and sub-national levels has led to a significant increase in the numbers of public and private players in nature policy. This in turn has increased the need for a common vocabulary to articulate and communicate views and values concerning nature among various actors acting on different administrative levels. In this article, we will examine the role of concepts of nature as communicative devices in public debates and political decision-making. We try to show that the now dominant functionalist approach to concepts of nature, due to its focus on interests, threatens to narrow public and political communications to purely strategic negotiations. Instead of this functionalist approach we put forward a structuralist approach, which focuses not on interests but on values. Keulartz is in applied philosophy, Wageningen University and Research Center, Wageningen, The Netherlands. van der Windt and Swart are in the Science and Society Section, Department of Biology, University of Groningen, The Netherlands. (EV)

Keulartz, Jozef, The Struggle for Nature: A Critique of Radical Ecology. London: Routledge, 1999. 208 pages. \$ 23. Originally published in Dutch in 1995. Keulartz finds environmental philosophy to be "a young discipline that has swiftly gained international academic success ... due to the rapid growth of a strong consensus among the most prominent environmental philosophers on the basic tenets of the discipline, a consensus which has enabled them to close ranks and unite into a single front" (p. 1) (!!!) Nevertheless he dismisses rather easily deep ecology, social and political ecology, ecofeminism and eco-anarchism, environmental pragmatism, and all the others, criticizing the dependence on science of these philosophies and the social problems they engender, often because this "has a stifling effect on all those voices trying to make themselves heard in the social debate about a future sustainable society that base

their case on other than ecological considerations" (p. 21). Power struggles are the real determinants, and "bio-power" struggles important among these. Keulartz argues for a "post-naturalistic" environmental philosophy. It is no longer enough to be post-modern; we also need to be post-natural. Keulartz is in the Department of Applied Philosophy at Wageningen Agricultural University, Netherlands. (v10,#4)

Kheel, Marti, "The Liberation of Nature: A Circular Affair," Environmental Ethics 7(1985):135-149. A major criticism of both of the dominant schools in environmental ethics: individualism and holism. Both

camps seem to be locked into a dualistic mind-set that has dominated and exploited men and women, nature, and the lower classes of human beings. What is needed in environmental ethics is a new feminist holism which values the whole and its parts, using both reason and emotion. This is one of the better essays on feminism and environmental thought, yet it remains unsatisfying because it relies on a nonrational solution to environmental problems. (Katz, Bibl # 1)

Kheel, Marti, "Ecofeminism and Deep Ecology: Reflections on Identity and Difference," in Robb and Casebolt, above. An abridged version is in Diamond and Ornstein, above. Ecofeminism and deep ecology share the view that ecological problems arise from a failure to feel connected to all life. Deep ecology transcends human self-consciousness. But Kheel warns that the tasks involved in reconnecting human sensibilities with the rest of nature are quite different for women than for men, because the self is different for the two genders. This is illustrated with sport hunting. The crucial spiritual problem in the environmental crisis is not anthropocentrism but androcentrism.

Kheel, Marti, *Nature Ethics. An Ecofeminist Perspective* (Rowman & Littlefield Publishers, 2008). Reviewed by Richard P. Haynes in *Journal of Agricultural and Environmental Ethics* 21(2008):469-475.

Kheel, Marti. *Nature Ethics: An Ecofeminist Perspective*. Lanham, MD: Rowman & Littlefield Publishers, 2007. Kheel discusses four representatives of holist philosophy Theodore Roosevelt, Aldo Leopold, Holmes Rolston III, and Warwick Fox and argues that their moral allegiance to abstract constructs such as species and ecosystems represents a masculinist orientation that devalues concern for individual animals. She develops an ecofeminist philosophy that stresses the importance of care and empathy for both individual beings and larger wholes. Her discussion of Fox as a transpersonal Self deep ecologist is somewhat dated, as Fox is no longer a deep ecologist.

Kheel, Marti. "The Liberation of Nature: A Circular Affair." Environmental Ethics 7(1985):135-49. I show the relevance of feminist thought to some of the major debates within the field of environmental ethics. The feminist vision of a holistic universe is contrasted with the dualistic notions inherent in both the "individual rights" and traditionally defined "holist" camps. I criticize the attempt in environmental ethics to establish universal, hierarchical rules of conduct for our dealing with nature (an up-down dualism) as well as the attempt to derive an ethic from reason alone (the dualism of reason and emotion). I maintain that the division between the "holist" and "individual rights" camps is yet another form of dualist thinking, and propose in its stead a holistic vision that concerns itself both with the individual and with the whole of which the individual is a part. Kheel is co-founder of Feminists for Animal Rights, Oakland, CA. (EE)

Kidd, Charles V., "The Evolution of Sustainability", Journal of Agricultural and Environmental Ethics 5(1992):1-28. The roots of the term "sustainability" are so deeply embedded in fundamentally different concepts, each of which has valid claims to validity, that a search for a single definition seems futile. The existence of multiple meaning is tolerable if each analyst describes clearly what he means by sustainability.

Kidd, Charles V., "The Evolution of Sustainability," Journal of Agricultural and Environmental Ethics 5(no. 1, 1992):1-26. (v5,#1)

Kidner, David W., Nature and Psyche: Radical Environmentalism and the Politics of Subjectivity. Albany: State University of New York Press, 2000. Psychological and environmental writing are all too often colonized by the same assumptions that inhibit ecological and cultural diversity. Industrialized monocultures conceal the character of our alienation from nature and, thus, prevent the emergence of effective solutions. Traditional psychological understanding is often inherently hostile to the natural order, and the dominant form of selfhood that has emerged in the industrialized world promotes the domestication of nature. In fact, even some of the most radical environmentalists, who simplistically oppose technology, are also trapped within this paradigm. A more critical historical and cultural awareness, rooted in nature, can enable a re-integration of nature and psyche. Kidner is in psychology, humanities, and communication studies at Nottingham Trent University. (v.11,#3)

Kidner, David W., "Why Psychology Is Mute about the Environmental Crisis." Environmental Ethics 16(1994):359-376. Psychology, often defined as the science of human behavior, has so far had little to say about the environmental destruction which is currently occurring as the result of human behavior. I consider the reasons why it has not and suggest that the ideological preconceptions that underpin the discipline are similar to those of the technological-economic system that is largely responsible for degradation of the environment. Psychology, by normalizing the behavioral, life-style, and personality configurations associated with environmental destruction, and lacking a historical perspective on changes in consciousness and technology, is unable to contribute effectively to the ecological debate. I conclude that the discipline needs to locate itself historically and ideologically before it can offer an adequate analysis of environmental destruction. Kidner is with the Dept. of Secondary and Tertiary Education, Nottingham Trent University, England. (EE)

Kidner, David W. "Fabricating Nature: A Critique of the Social Construction of Nature." Environmental Ethics 22(2000):339-357. Models of nature have usually referred to ecological, or more generally, scientific understandings, and have seldom included cultural factors. Recently, however, there has been a trend toward defining nature as a "social construction," that is, as an artifact of human social and linguistic capability. I argue that constructionism attempts to assimilate nature to an exclusively anthropocentric "reality," and that it should be seen as expressing long-term industrialist tendencies to separate the "human" and the "natural" realms and to assimilate the latter to the former. Consequently, the constructionist approach, rather than offering us a fertile means of incorporating cultural influences within

environmental theorizing, is better viewed as a cognitive counterpart to industrialism's physical assimilation of the natural world. (EE)

Kidner, David W. "Industrialism and the Fragmentation of Temporal Structure." Environmental Ethics 26(2004):135-153. Industrialism's assimilation of the natural world has developed over the centuries through complex hierarchies of effects involving ecological, cultural, and psychological dimensions. One of the consequences of this assimilation is the fragmentation of the temporal structure of the world and its replacement by a short-term logic that also infects human subjectivity. Because of this fragmentation, the healing of the natural world cannot be realized either simply or directly, and effective action requires us to locate our immediate objectives within a recovered longer-term vision of a healthy natural world. (EE)

Kidner, David W. "Culture and the Unconscious in Environmental Theory." Environmental Ethics 20(1998):61-80. I argue that much current environmental theory is unwittingly grounded in assumptions about personhood that entangle it within existing ideology. Culture theory, I suggest, offers a way out of this entanglement through its perception of our immersion within a symbolic realm which precedes consciousness. Environmental theory, by embodying, articulating, and legitimating cultural forms, can avoid being assimilated by those individualistic and scientific assumptions which undermine its potential. Kidner is in secondary and tertiary education, Nottingham Trent University, UK. (EE)

Kidner, David W. "Fraud, Fantasy, and Fiction in Environmental Writing." Environmental Ethics 27 (2005):391-410. During the past several decades, a number of accounts of environmental and ethnic wisdom have appeared which have later been exposed as fraudulent. The widespread popularity of these accounts should be understood as symptomatic of valid feelings and awarenesses that are unable to find expression in the modern world, and are usually dissociated from mainstream decision-making processes. As the natural order continues to be degraded, forms such as fiction which currently have relatively low status will become more important as vehicles for feelings, ideas, and possibilities which can find no other refuge within a world increasingly dominated by technological and economic viewpoints. Kiers, E. Toby, Roger R.B. Leakey, Anne-Marie Izac, Jack A. Heinemann, Erika Rosenthal, Dev Nathan, and Janice Jiggins. "Agriculture at a Crossroads." *Science* Vol. 320, no. 5874 (18 April, 2008): 320-21. The present path of agricultural development will not achieve development goals, but there are opportunities for improvement. Agriculture is the single largest threat to biodiversity, requiring more land, water, and human labor than any other industry. Some 75% of the world's poor and hungry live in rural areas and depend directly or indirectly on agriculture for their livelihoods. Governing agriculture requires new thinking, new technology to reduce hunger and poverty and to facilitate equitable, sustainable development. Kiers is at the Institute of Ecological Science at Vrije Universiteit, Amsterdam.

Kiester, A. Ross, "Aesthetics of Biological Diversity," Human Ecology Review 3 (no. 2, 1996):151-157. Aesthetic value is included in virtually all accounts of the values of biodiversity, but this value is still incompletely understood. Here I offer an account of the aesthetics of biodiversity based on the understanding of aesthetics developed by Immanuel Kant. The claim of this analysis is that (to use Kant's terminology) while individual organisms may be considered beautiful, biodiversity as a whole is sublime.

This distinction poses challenges and opportunities for those who manage lands for biodiversity value. Comparison to managing art museums and wine cellars and a new vision for the role of systematics and taxonomy offer some insight into the management of the sublime aspects of biodiversity. Kiester is with the U.S. Forest Service, Corvallis, OR. Followed by: Ribe, Robert G., "Commentary on 'Aesthetics of Biological Diversity'" 3 (no. 2, 1996):158-160, and Levine, Steven Z., "'Aesthetics of Biological Diversity' by A. Kiester, Edwin, Jr., "A New Park Saved the Tall Trees, but at a High Cost to the Community," Smithsonian, October 1993. The full-sized Redwood National Park in northern California is fifteen years old, but the surrounding area is still searching for economic recovery, partially because visitor use of the park has only been about one-third of what was predicted. The two affected counties Del Norte and Humboldt are depressed. Preservation and restoration efforts with the redwoods have been impressive, though the article rings with melancholy for persons affected by a lumber industry that is no more, even if the saved redwoods would have sustained the industry only for another decade or so, and even if lumber industries were reducing their labor due to automation. A sad story of an exploitive economy gone bust, but a redwoods park does survive. (v4,#4)

Kiley-Worthington, M., "Ecological, Ethological, and Ethically Sound Environments for Animals: Toward Symbiosis", Journal of Agricultural Ethics 2(1989):323-347. There are inconsistencies in the treatment and attitudes of human beings to animals and much confusion in thinking about what are appropriate conditions for using and keeping animals. This article outlines some of these considerations and then proposes guidelines for designing animal management systems. Different ethical positions toward animals and their treatment are briefly outlined, and it is argued that, provided animals are in ecologically and ethologically sound environments, their use by human beings is ethically acceptable. Kiley-Worthington is in agriculture at the University of Edinburgh, Scotland.

Kilman, Scott, "McDonald's, Other Fast-Food Chains Pull Monsanto's Bio-Engineered Potato," The Wall Street Journal (4/28/00), Dillin, John, "White House enters the biotech food fight," The Christian Science Monitor (5/5/00): 1, and Melody Petersen, "U.S. to Keep a Closer Watch On Genetically Altered Crops," New York Times (5/4/00): A23. Setbacks for gene-altered foods in the U.S. According to one estimate, 60 percent of the products in America's grocery stores contain some genetically modified ingredients. But with consumer skepticism about biotech foods continuing to grow, U.S. farmers are now reversing the trend toward more biotech foods and plan to grow millions fewer acres of genetically modified, corn, soybeans and cotton. Fast-food chains such as McDonald's and potato chip makers Frito-Lay and Procter and Gamble are telling their potato suppliers to stop using genetically modified potatoes. At the prompting of food companies hoping to quiet consumer fears, the U.S. Federal government is reviewing its regulations on biotech foods. Plans are under way to require genetically engineered crops to be kept separate from those that are not so altered and to require biotech companies to notify regulators four months before new biotech products enter the food supply. Critics argue that the changes are far too modest. They are sponsoring legislation that would require mandatory labeling of genetically-altered foods (a proposal strongly opposed by the industry). Congressman Dennis Kucinich of Ohio, a leading critic of biotech foods, charges that biotech food companies are "arrogantly assuming god-like power to bring forth a second genesis" and are "combining genetic materials from plants, animals, and humans in some weird commercial potion and then marketing it for all to consume." The director of the Center for Food Safety Andrew Kimbrell says: "Genetic engineering allows you to mix life forms that have never been mixed in traditional breeding. At least, I am not aware of any instance when a flounder has been mated with a tomato." (v.11,#4)

Kim, Ke Chung, "Preserving Biodiversity in Korea's Demilitarized Zone," Science 278(1997):242-243. The demilitarized zone separating North and South Korea has been uninhabited by humans for 45 years, rigidly enforced, and this provides sanctuary to endangered animals and plants. Damaged forests have been rehabilitated and farmlands that are thousands of years old have returned to a natural state. The DMZ has, in fact, become a unique nature reserve containing the last vestiges of Korea's natural heritage. The Korean Peace Bioreserves System provides a strategy to preserve the rich biodiversity of the DMZ, and here is one place North and South Korea can work together. Kim is at the Center for Biodiversity Research, Pennsylvania State University. (v.8,#4)

Kim, Ke Chung, and Robert D. Weaver, eds. Biodiversity and Landscapes: A Paradox of Humanity. New York: Cambridge University Press, 1994. 431 pages. Hardbound only and expensive, \$60. Can civilization be sustained, and for how long, without fundamental changes that ensure the conservation and restoration of natural landscapes and biological diversity? What role will science and technology play? What fundamental changes must we make for the sustained evolution of human civilization? 22 contributors. The philosophers are: Bryan G. Norton, "Thoreau and Leopold on Science and Values"; Holmes Rolston, III, "Creation: God and Endangered Species"; Eric Katz, "Biodiversity and Ecological Justice"; and Eugene Hargrove, "The Paradox of Humanity: Two Views of Biodiversity and Landscapes." Many other contributors address ethical questions as well, and all of them have policy implications. Samples: James Karr, "Landscapes and Management for Ecological Integrity"; Alan Randall, "Thinking about the Value of Biodiversity"; M. Rupert Cutler, "The Watchdog Role of Nongovernmental Environmental Organizations." Kim is at the Center for Biodiversity Research, Pennsylvania State University; Weaver is in agricultural economics and rural sociology there. (v6,#1)

Kim, Sung-Hae. "The Immortal World: The Telos of Daoist *Environmental Ethics*." *Environmental Ethics* 30(2008):135-157. Four Daoist texts illustrate the dynamic image of the Daoist immortal world on which a Daoist *Environmental Ethics* can be built. The first text is the Daodejing with two of the oldest commentaries. The second is Tao Hongjing's Diagram of Rank and Functions of True Spirits. The third is the collection of poems by Immortal Changchun, titled Panxiji. The fourth is the Morning and Evening Liturgical Prayer Book of the Quanzhen Order, which represents Daoist ecological concerns for the

natural world. Daoism not only accords with the impetus and spirit of *Environmental Ethics* but can also make a concrete contribution to its implementation. (EE)

Kimmins, J. P. (Hamish), "Ecology, Environmentalism and Green Religion," The Forestry Chronicle (Canada), 69 (no. 3, June):285-289. Management of forests to optimize the many values there will not be

successful if based solely on the science of ecology, because this science cannot tell foresters what their goals should be. There really is no such thing as "ecologically sound" or "ecologically destructive" forest management outside the context of a society's prevailing value judgment system. Management will also fail if based solely on green religion, because this frequently ignores the ecological requirements of many of the living organisms in forest systems. By "green religion" Kimmins seems to mean beliefs about forest ecosystems that are held contrary to what he thinks is sufficient evidence to the contrary. In any case, foresters need to learn from those Kimmins calls "environmentalists," who have sensitized contemporary society to the diverse values in forests, much better than did ecologists or foresters, but to avoid the blind faith of green religion. Kimmins is in forest ecology at the University of British Columbia. (v5,#4)

King, Roger J. H. "Environmental Ethics and the Case for Hunting." Environmental Ethics 13(1991):59-85. Hunting is a complex phenomenon. I examine it from four different perspectives--animal liberation, the land ethic, primitivism, and ecofeminism--and find no moral justification for sport hunting in any of them. At the same time, however, I argue that there are theoretical flaws in each of these approaches. Animal liberationists focus too much on the individual animal and ignore the difference between domestic and wild animals. Leopold's land ethic fails to come to terms with the self-domestication of humans. I argue that the holism of the land ethic does not in itself justify hunting as a human act of predation appropriate to the demands of wild biotic communities. Primitivists, such as Paul Shepard and Ortega y Gasset, mistakenly argue that hunting is an essential part of human nature and hence part of a healthy return to a natural way of life. Their argument marginalizes women's relations to nature. Finally, I take seriously the ecofeminist claim that sport hunting is a symptom of patriarchy's fixation on death and violence, although I criticize the more radical claim that women are closer to nature than men. Hunting should be investigated within the broader context of patriarchal social

relations between men and women. As an act of violence it constitutes one element of a cultural matrix which is destructive to both women and nature. King is in the department of philosophy, University of Maine, Orono, ME. (EE)

King, Roger J. H. "Environmental Ethics and the Built Environment." Environmental Ethics 22(2000):115-131. I defend the view that the design of the built environment should be a proper part of environmental ethics. An environmentally responsible culture should be one in which citizens take responsibility for the domesticated environments in which they live, as well as for their effects on wild nature. How we build our world reveals both the possibilities in nature and our own stance toward the world. Our constructions and contrivances also objectively constrain the possibilities for the development of a human way of life integrated with wild nature. An environmentally responsible culture should require a built world that reflects and projects care and respect toward nature. (EE)

King, Roger J. H., "How to Construe Nature: Environmental Ethics and the Interpretation of Nature." Between the Species 6 (1990): 101-108. A criticism of the dominant method of environmental ethics, the search for objective value in natural entities. Nature is subject to contextualist strategies of inquiry; the value of Nature "depends on the place which Nature has acquired in our discourses with one another" (p. 101). (Katz, Bibl # 2)

King, Roger J.H., "Narrative, Imagination, and the Search for Intelligibility in Environmental Ethics," Ethics and the Environment 4(1999):23-38. This essay presents a contextualist defense of the role of narrative and metaphor in the articulation of environmental ethical theories. Both the intelligibility and persuasiveness of ecocentric concepts and arguments presuppose that proponents of these ideas can connect with the narratives and metaphors guiding the expectations and interpretations of their audiences. Too often objectivist presuppositions prevent the full contextualization of environmental ethical arguments. The result is a disembodied environmental discourse with diminished influence on citizens and policy makers. This essay is a pragmatist call for more philosophical attention to locating speakers, audiences, and meanings in more intelligible "discursive spaces." King is in philosophy at the University of Maine, Orono. (E&E)

King, Sallie, Steven Keffer and Steven Kraft. "Process Philosophy and Minimalism: Implications for Public Policy." Environmental Ethics 13(1991):23-47. Using process philosophy, especially its view of nature and its ethic, we develop a process-based environmental ethic embodying minimalism and beneficence. From this perspective, we criticize the philosophy currently underlying public policy and examine some alternative approaches based on phenomenology and ethnomethodology. We conclude that process philosophy, minus its value hierarchy, is a powerful tool capable of supporting both radical and moderate changes in environmental policy. Keffer is in the department of Zoology, King is in the department of philosophy, Kraft is in the department of Agribusiness Economics, Southern Illinois University at Carbondale, Carbondale, IL. Kintisch, Eli, "Evangelicals, Scientists Reach Common Ground on Climate Change," Science 311 (24 February 2006): 1082-1083. A statement by the National Association of Evangelicals, formulated in consultation with scientists, argues for mandatory controls on U.S. greenhouse gas emissions. A leading figure is atmospheric scientist John Houghton, former co-chair of the Intergovernmental Panel on Climate Change report, also a Christian (www.christiansandclimate.org). A story in Christian Century, "Evangelicals Split on Global Warming," March 7, 2006, p. 10, gives more attention to the evangelicals that refused to support the statement.

Kintisch, Eli, "Court Tightens Rules on Gene Tags," Science 309(16 September, 2005):1797-1799. In a new court ruling, researchers cannot patent DNA strands that bind genes whose function is unknown. The ruling involved agbiotech giant Monsanto involving strings of corn DNA. It involved patents for gene-grabbing tools called expressed sequence tags (ESTs). The court thinks patentable innovations ought to be "useful," and not just "tools along the way." Generally, the ruling frees researchers to do more research without worries about patents, and argues that to be patentable an invention must have both a "significant and presently available [and] well defined" benefit.

Kintisch, Eli. "Tougher Ozone Accord Also Addresses Global Warming." Science Vol. 317, no. 5846 (28 September 2007): 1843. The Montreal Protocols on chlorofluorocarbons (CFCs), now twenty years old, have been periodically strengthened, and the latest round also has measures that reduce global warming.

Kintisch, Eli. "Making Dirty Coal Plants Cleaner." Science Vol. 317, no. 5835 (13 July 2007): 184-86. Worldwide and also in the U.S., coal plants produce about one-third of all carbon dioxide emissions. In the U.S., this greatly surpasses all the emissions produced by cars and all other industries combined. China is now the largest carbon dioxide emitter. But cleaning up the dirt plants is not cheap.

Kintisch, Eric. "Wall Stall." Science Vol. 315, no. 5810 (19 Jan 2007): 315. The massive Israeli defense wall may block Palestinians, but the wildlife? Israeli Defense Minister Amir Peretz has announced that, in the midst of lawsuits by environmentalist organizations, he is suspending construction on the 300

kilometer separation wall into the southeastern Judean Desert. The wall is in most places an eight foot high cement barrier, but Israeli biologists and environmentalists want the government to build a chain link fence that will allow small animals to pass through, and even to make some allowances for ibex and wolves.

Kipnis, Kenneth and South, David B, "Personal Values and Professional Ethics," Journal of Forestry 98 (No. 7, 2000 July 01): 11- . A professional code of ethics should reflect the core values of the profession: the question before SAF, then, is whether each principle in the proposed new code expresses a value we all share. (v.11,#4)

Kirchmann, Holger, "Biological Dynamic Farming - An Occult Form of Alternative Agriculture?", Journal of Agricultural and Environmental Ethics 7(1994):173-188. An analysis of the theory of biodynamic farming, founded by Austrian Rudolf Steiner, Ph.D., is presented. His purpose was to show mankind a form of agriculture that enables not only the production of healthy foods but also the achievement of harmonious interactions in agriculture and a spiritual development of mankind through "cosmic forces" captured in the foods. Those predictions that can be tested scientifically have been found to be incorrect. It is concluded that Steiner's instructions are occult and dogmatic and cannot contribute to the development of alternative or sustainable agriculture.

Kirkham, Georgiana, "'Playing God' and 'Vexing Nature': A Cultural Perspective," Environmental Values 15(2006): 173-195. In this paper I examine the twin concepts of 'playing God', and its secular equivalent that which I term for the purpose of this discussion 'vexing Nature' as they relate to arguments against (or for) certain human technological actions and behaviours. While noting the popular subscription to the notion that certain acts constitute instances of 'playing God' or interfering in the natural order, philosophers often deny that such phrases have any application to the central ethical issues in the areas where they are most commonly applied. I examine, in detail, the interpretations of these phrases put forward by bio-ethicists Ruth Chadwick and John Harris and argue that the concepts 'playing God' and 'vexing nature' are best understood as an expression of a moral intuition that is both significant and deserving of serious philosophical attention. My contention is that intuitions of this kind often express a concern for the virtue of, and doubt about the intentions of, the agent whose acts are described in these terms, and that these concepts are best understood as part of an historical and cultural continuum specific to the Western tradition. Understood as such, this indicates that debate continues over the purpose of art and technology, and the place of humanity within the natural environment, and that a kind of traditional teleological virtue ethics still exerts a significant influence on popular conceptions of the moral issues underlying this debate. Kirkman, Robert, Skeptical Environmentalism: The Limits of Philosophy and Science. Bloomington: Indiana University Press, 2002. Reviewed by Norva Y.S. Lo in Environmental Values 14(2005):519-522.

Kirkman, Robert, Environmentalism Without Illusions: Rethinking the Roles of Philosophy and Ecology." December 1995, PhD thesis in philosophy at the State University of New York at Stony Brook. Drawing from his studies of the history and philosophy of the natural sciences (especially ecology), phenomenology, and the history of the philosophy of nature, Kirkman raises an epistemological challenge to environmental philosophy insofar as it is grounded in factual claims about the world. He concludes that many of these claims are unwarranted, particularly those which come about through an appropriation, or rather a misappropriation, of scientific concepts. Finally, he recommends that environmental philosophers attend more carefully to the scope and limits of human knowledge, and that they shift their

emphasis away from the construction of speculative cosmological or ethical systems to a more direct engagement in seeking practical solutions to environmental problems. Address: P.O. Box 438, Millwood, NY 10546. Email: <bandreoba@aol.com>. (v7,#1)

Kirkman, Robert, Skeptical Environmentalism: The Limits of Philosophy and Science. Bloomington: Indiana University Press, 2002. A critical overview of the speculative tendencies of academic environmental philosophy. Drawn in part from sources in the history of philosophy and the history and philosophy of the natural sciences, the argument concludes with a reconception of environmental problems, and of the proper roles of philosophy and the natural sciences in addressing them. Kirkman is in science and technology studies, Lyman Briggs School, Michigan State University, East Lansing. (v.13,#1)

Kirkman, Robert, "Darwinian Humanism: A Proposal for Environmental Philosophy," *Environmental Values* 16(2007): 3-21. There are two distinct strands within modern philosophical ethics that are relevant to environmental philosophy: an empiricist strand that seeks a naturalist account of human conduct and a humanist strand rooted in a conception of transcendent human freedom. Each strand has its appeal, but each also raises both strategic and theoretical problems for environmental philosophers. Based on a reading of Kant's critical solution to the antinomy of freedom and nature, I recommend that environmental philosophers consider the possibility of a Darwinian humanism, through which moral agents are understood as both free and causally intertwined with the natural world. Kirkman is in the School of Public Policy, Georgia Institute of Technology, Atlanta, GA.

Kirkman, Robert. "Why Ecology Cannot Be All Things to All People: The "Adaptive Radiation" of Scientific Concepts." Environmental Ethics 19(1997):375-390. On the basis of a model of the development of scientific concepts as analogous to the "adaptive radiation" of organisms, I raise questions concerning the speculative project of many environmental philosophers, especially insofar as that project reflects on the relationship between ecology (the science) and ecologism (the worldview or ideology). This relationship is often understood in terms of an opposition to the "modern" worldview, which leads to the identification of ecology as an ally or as a foe of environmental philosophy even as ecological concepts are freely appropriated to inform speculation. I argue that ecology does not fit into the intellectual framework of such an opposition and that its concepts cannot readily be made to serve purposes outside of their specialized context without a loss of meaning. Finally, I suggest that environmental thought might do well to divest itself of its ecologicistic commitments, adopting instead a skeptical approach to human-environment relations. Kirkman, Robert. "Reasons to Dwell on (if Not Necessarily in) the Suburbs." Environmental Ethics 26(2004):77-95. Environmental philosophers should look beyond stereotypes to consider American suburbs as an environment worthy of serious philosophical scrutiny for three reasons. First, for better or worse, the suburbs are the environment of primary concern to most Americans, and suburban patterns of development have caught on elsewhere in the industrialized world. Second, the suburbs are much more of a problem than many environmental theorists suppose, in part because suburban patterns of development are entrenched and difficult to change, and in part because they pose an important challenge to the very idea of an environmental ethic. Third, the search for sound policies and practices for metropolitan growth involves two crucial tasks for which philosophers may be particularly well suited: grappling with the ethical complexity of the suburbs, and fostering a robust and nuanced normative debate about the future of the built environment. Butterflies at weddings? At weddings all across the country, the smiling newlyweds are suddenly surrounded by a fluttering cloud of butterflies released by guests. But scientists say the fad may cause problems, and have called for a ban on such releases. Others deny there is likely to be a problem. (v.10,#1)

Kirn, Andrej, "Nekoliko temeljnih dilema eloloske etike (Some Basic Dilemmas of Ecological Ethics)," Socijalna Ekologija (Zagreb, Croatia) 7(No. 3, 1998):257-270. In Croatian. The relationship between nature and society directly determines the possibility of establishing an ecological ethics. The relation to nature has always implied also the relation towards men and inversely. An "efficient" use of nature begins with submitting of a man by another man. Contemporary processes of technological and ecological globalization do not dissolve this historical relation between man and nature, but elevate it on a higher level and give it a new form. There have been three important historical socioecological transformations: the paleolithic, the neolithic and the industrial. Mankind is now entering a fourth post-industrial and postmodern period, which transcends the traditional opposition between nature and society leading towards a complete dissolution of society within nature (naturalism), and inversely - towards the dissolution of nature within society (social constructivism of nature). A complete naturalization the social excludes and makes ecological ethics impossible. The intrinsic ecological ethics can be conceived both instrumentally and anthropocentrically. The predominance of anthropocentricity has begun with modernism and enlightenment, as man started to be understood even more as a subject - as a basis of the all being. Discussion of Callicott, Oelschlaeger, Harlow, Roderick Nash, Paul Taylor, and others. Key words: anthropocentricity, anthropocentrism, intrinsic and instrumental ecological ethics, nature, society. His assessment of the potential outcomes of genetic technology on the human future grows out of that experience. Three percent of the funds for the Project have been earmarked for the study of the ethical, legal, and social implications of the project. Reviewed by Lisa Gannett in Biology and Philosophy 12(1997):403-419. (v8,#3)

Kitcher, Philip, "Responsible Biology," BioScience 54(no. 4, 2004):331-336. Responsible biologists reflect on the ends of their research and they ought to work toward an ideal of well-ordered science understood in a global and democratic fashion. In particular this means more research on ecological issues, such as the environmental degradation in tropical forests. But even more serious is shifting the proportions of medical research toward global health for the poorer nations. At present only 10% of the world's scientific resources are spent on the diseases that afflict 90% of Earth's population. This is not well-ordered science. Kitcher is in philosophy, Columbia University.

Klare, Michael T., *Resource Wars: The New Landscape of Global Conflict*. New York: Metropolitan Books, 2001. Nation states and their armies will increasingly define resource security as their main mission, with resulting widespread instability, especially where mounting demand collides with long-

standing territorial and religious disputes. There is a new geography of conflict based on scarce resources concentrated in regions where the human rights picture is dimmest.

Klarer, Jurg, Moldan, Bedrich. The Environmental Challenge for Central European Economies in Transition. Chichester, U.K.: John Wiley and Sons, 1997. 300 pp. £ 45, cloth. The authors outline the state of the environment in Central and Eastern Europe since the decline of Communist rule with attention given to air and water pollution, land management and nature conservation, and the consequences of environmental degradation such as human health, biodiversity losses, and economic damage. Secondly they outline the causes of environmental degradation and discuss the failure of the Communist regime to address environmental issues and compare this to the failure of mixed capitalist economies. They analyze the present policies in place within the countries and the developments likely to unfold in Eastern Europe in the future, as well as the social and economic factors used to facilitate these changes. (v8,#2)

Klaver, Irene, Jozef Keulartz, Henk van den Belt, and Bart Gremmen. "Born to be Wild: A Pluralistic Ethics Concerning Introduced Large Herbivores in the Netherlands." With the turning of wilderness areas into wildlife parks and the returning of developed areas of land to the forces of nature, intermediate hybrid realms surface in which wild and managed nature become increasingly entangled. A partitioning of environmental philosophy into ecoethics and animal welfare ethics leaves these mixed territories relatively uncharted—the first dealing with wild (animals), the second with the welfare of captive or domestic animals. In this article, we explore an environmental philosophy that considers explicitly these mixed situations. We examine a recent Dutch policy of introducing domesticated and semi-wild large herbivores in newly developed nature areas. Larger issues are at stake, such as the intertwining of nature and culture, the dynamic character of de-domestication processes, and the relation between concepts of authenticity and the wild. We sketch a pluralistic, dynamic, and pragmatic environmental philosophy that is capable of dealing with the complicated ethical problems concerning creatures and land caught between domestication and the wild. Environmental Ethics 24(2002):3-21. (EE)

Klenk, Nicole, "Listening to the Birds: A Pragmatic Proposal for Forestry," Environmental Values 17(2008):331-351. Recently, natural scientists have begun to support an interpretive turn in ecology. Yet the ethical implications of interpreting nature have not been sufficiently addressed. In this essay, I use different interpretations of nature to make three distinct but related points relevant to forestry: (1) ecological narratives should be evaluated on the basis of ethical norms, (2) the choice of which interpretations of nature and ethical norms to use in environmental policy should be conducted by a process of public deliberation, and (3) scientific narratives should be denied a priori privilege over non-scientific interpretations of nature for policy purposes.

Kline, A. David. "We Should Allow Dissection of Animals." Journal of Agricultural and Environmental Ethics 8(1995):190-197. The focus of the paper is the ethical issues associated with the practice of dissecting animals in lower level college biology classes. Several arguments against dissection are explored. Furthermore, the issue is examined from the point of view of the instructor's academic freedom and the point of view of a student's moral autonomy. It is argued that even though the arguments against dissection fail, it is very important to respect the moral autonomy of students who oppose the practice. Often this can be accomplished in a manner that is consistent with academic freedom and good science education. (JAEE)

Kline, Benjamin, First Along the River: A Brief History of the U. S. Environmental Movement. San Francisco, CA: Acada Books, 1997. 176 pages. "The environmental movement is part of a long struggle to manage our natural resources more responsibly. What we decide to do about our environment today affects human existence forever, whether for good or bad. ... Despite many obstacles, the people of the United States have accepted the daunting challenge of dealing with environmental decay and, with the often contentious behavior of an open society, accomplished a great deal" (p. 139). Kline teaches history at San Jose State University, San Jose.

Kline, Benjamin, First Along the River: A Brief History of the U.S. Environmental Movement. San Francisco: Acada Books, 1998. Claims to be the first concise overview of the United States environmental movement from the colonial era to the present. Kline teaches environmental history at San Jose State University. (v9,#1)

Kline, Ronald R., "Resisting Development, Reinventing Modernity: Rural Electrification in the United States before World War II," Environmental Values 11(2002):327-344. The essay examines local resistance to the New Deal rural electrification program in the United States before World War II as a crucial aspect of socio-technical change. Large numbers of farm men and women opposed the introduction of the new technology, did not purchase a full complement of electrical appliances, and did not use electric lights and appliances in the manner prescribed by the government modernizers (the Rural Electrification Administration) and manufacturers. These acts of "transformative resistance" helped to

shape artifacts and social practices. (EV)

Kline, Syril. "The Invasion of the Winged One." The Christian Science Monitor, vol. 88, 18 Oct. 1996, p. 16.

Klinkenborg, Verlyn, "The Mustang Myth," Audubon 96 (no. 1, January/February 1994):34-43. America's wild horses have inspired one of the nation's most passionate conservation battles, but how much of the "wildness" is in the horses and how much is in our minds? Horses were domesticated late, about 5,000 years ago, some 2,000 years after cattle, more than 4,000 years after sheep and goats, and perhaps as many as 7,000 years after dogs. The Spanish mustangs that multiplied across the Western range were the products of more than 5,000 years of coevolution with humans. The fact that they can be adopted and re-domesticated as easily as they can is evidence of this. Once a species is domesticated, it can never again become fully wild. They are feral, not wild. There is no adopt-a-coyote program because coyotes are truly wild and cannot be domesticated. The wildness of wild horses like the wildness of humans is a metaphor. Humans cannot represent wild horses without conceptualizing them, without making an issue of their history or their association with Indians or especially their freedom, their symbolic value. No matter how hard you try to acknowledge the intrinsic reality of their lives--what you might call the "ownness" of their existence--they soon become almost ghostly with abstraction. And the greatest abstraction of all is wildness.

Klinkenborg, Verlyn, "The Self-Discipline of Leaving Room for Nature in the Gulf of Mexico," New York Times, July 8, 2004. An op-ed piece following encounter with a Kemp's ridley sea turtle, and its determination to survive. (v. 15, # 3)

Klint, K.K., et al., 2003. "Making The EU 'Risk Window' Transparent: The Normative Foundations Of The Environmental Risk Assessment Of GMOs." Environmental Biosafety Research 3:161-171. In Europe, there seems to be widespread, morally based scepticism about the use of GMOs in food production. Mapping the value judgements that are made in an environmental risk assessment and approval procedure, we describe the political liberal nature of the EU legislation.

Kloor, Keith, "Lynx and Biologists Try to Recover After Disastrous Start," Science 285(1999):320-321. A Science story on the troubled effort to bring lynx back to Colorado, mired in controversy after five animals starved to death this year. Some think the risk justified; some think it bad science; some think it morally wrong, putting the lynx to unjustified risk and suffering. (v.10,#3)

Kloor, Keith, "A Surprising Tale of Life in the City," Science 286(22 October, 1999):663. Ecologists are finding webs of life in the city more intricate than suspected. The U.S. National Science Foundation's Long Term Ecological Research program, mostly studying wild sites, added two urban sites for comparison, Phoenix and Baltimore, and discovered more biodiversity in the nooks and crannies, the lawns, waste lots, and parks of the cities than anticipated: 75 species of bees, 200 species of birds, and hundreds of species of insects in Phoenix, along with 2.8 million people. But the larger wildlife, such as bighorn sheep, were absent. Also 95% of plant species and one in four kinds of birds were introduced exotics. Still, says John Wiens, the bottom line is that "cities are not the kind of sterile wastelands that some people think." (v10,#4)

Kloppenbug Jr., Jack, Burrows, Beth. "Biotechnology to the Rescue? Twelve Reasons Why Biotechnology Is Incompatible with Sustainable Agriculture." The Ecologist 26(Mar.1996):61. Proponents of biotechnology claim that genetic engineering is the only way to achieve sustainable agriculture and feed the world's poor and hungry. In fact, genetic engineering will exacerbate many existing problems in agriculture and introduce new ones. The main beneficiaries will be its corporate backers. (v7,#2)

Klyza, Christopher McGrory, and David Sousa. *American Environmental Policy: 1990-2006: Beyond Gridlock*. Cambridge, MA: The MIT Press, 2008. Since 1980 environmental issues have been legislatively gridlocked between the Democrat and Republican parties in the United States and have engendered bitter interest group politics. This has forced environmental policy-making onto other pathways in the US, both inside and outside government. Klyza and McGrory analyze five alternative policy paths: appropriations politics in Congress, executive authority, the judiciary, policy-making at the state level, and next generation collaborative experiments. In spite of legislative gridlock, the authors argue that the policy legacies of the 1960s and 1970s live on in an enduring green US state, rooted in bureaucratic routines, statutes, and public expectations.

Kneller, Jane, "Beauty, Autonomy and Respect for Nature," a paper presented at "L'Esthetique de Kant," Centre Culturel International De Cerisy la Salle, in Normandy, France, June 15-21, 1993. Aesthetics was earlier much concerned with nature, subsequently mostly concerned with artifacts, and today there is a renewed interest in nature. Natural beauty is the centerpiece of Kant's account, and there is the possibility

of an account of intrinsic value in nature. On the other hand Kant claims that nothing is valuable in itself except the morally good will, and Kant can seem a pillar of anthropocentrism. Kneller argues for a nuanced account by which Kant does value nature for nature's sake, though there is a tension in Kant's thought with respect to nature's value in itself and the absolute value of the good will. She finds what "looks for all the world like an avowal of his belief in the intrinsic value both of external nature and the inner moral realm. Kant's account of the experience of the beautiful is perhaps best seen as his attempt to work out precisely this tension." Kneller is in the Department of Philosophy, Grinnell College, Grinnell IA 50122. (v4,#2)

Knetsch, Jack L., "Environmental Valuation: Some Problems of Wrong Questions and Misleading Answers." Environmental Values 3(1994):251-268. Contingent valuation of people's willingness to pay has rapidly become the method of choice to value all manner of environmental damages. The correct measure is, however, the sum people require to compensate them for such losses, an amount which will normally be far larger than their willingness to pay. And on present evidence, responses to contingent valuation questions are not likely to represent any measure of economic values. The results of these valuation practices will, therefore, bias environmental policies and distort incentives. KEYWORDS: Contingent valuation, endowment effect, valuation. Knetsch is at the School of Resource and Environmental Management, Simon Fraser University, British Columbia. (EV)

Knight, Richard L., and Kevin Gutzweiler, eds., Wildlife and Recreationists: Coexistence through Management and Research. Washington, DC: Island Press, 1995. 372 pages. Contains Max Oelschlaeger, "The Land Ethic and Outdoor Recreation," which uses Leopold's land ethic as a frame for critiquing the recreation industry that has emerged as big business in the last half of this century. Other papers note that recreation has more adverse effects on wildlife than often thought, but that careful management can reduce these impacts. (v5,#3)

Knights, Paul, "Native Species, Human Communities and Cultural Relationships," *Environmental Values* 17(2008):353-373. Species are ordinarily conceived of as being native or non-native to either a geographical location or an ecological community. I submit that species may also be native or non-native to human communities. I argue, by way of an analogy with varieties of domesticated and cultivated species, that this sense of nativity is grounded by the cultural relationships human communities have with species. A further analogy is drawn with the motivations of varietal nativists - who seek to protect native varieties of domesticated and cultivated species for the sake of their cultural value - to argue for the consideration of the cultural value of native species in environmental policy decisions regarding invasive non-native species.

Knox, Margaret L., "The Wise Use Guys," Buzzworm: The Environmental Journal, November/December 1990, pp. 30-36. "They love the land and can't stand to see it locked up." Features wise use advocates, such as Grant Gerber, founder of the Wilderness Impact Research Foundation, Elko, Nevada, to help fight the preservationists, or Ron Arnold of the Center for the Defense of Free Enterprise, Bellevue, Washington, who vows "to destroy the environmental movement once and for all" with legislation like the Property Rights Protection Act. The 167-page wise use agenda includes opening all wilderness to energy and mineral production, massive expansions of concessions in the national parks, amending the Endangered Species Act, amending the Wilderness System to allow hostels and toilets, developed campsites, motorized travel, and commodity industry in times of high demand, using gasoline taxes to build more ATV roads, and the systematic conversion of decadent old growth forests into young oxygen-producing stands to help reverse global warming.(v2,#1)

Knox, Margaret L., "In the Heat of the Hunt," Sierra, November/December 1990. Article on hunting, with subsidiary essays by a hunter and a non-hunter, also a short on an iguana hunt in Africa. Many environmentalists say the debate should not be about wildlife, but about ecosystems. Thinking about animals as a resource does for deer what the timber industry has done for old-growth forests. Militant anti-hunters share a moral certainty with anti-abortionists who throw blood on pregnant women entering planned parenthood clinics. Their fervor makes it easy for hunters to dismiss their arguments. (v1,#4)

Knudson, Douglas M., Cable, Ted T., Beck, Larry. Interpretation of Cultural and Natural Resources. State College, PA: Venture Publishing Co. 1995. 197pp. \$24.95. Case studies about innovative programs, facilities and management practices that are setting the pace in municipal recreation and park services. Examples: successful "contracting out," and creative partnerships to new ways to reach at-risk youth. Where municipal recreation and park services are headed and how to get there.

Ko, Dong, "Computer-based Environmental Management," Landscape Ecology 21 (no.4, May 2006): 627-628 (2).

Kocieniewski, David, "Where Eagles Fly into Eco-Political Fray," New York Times, June 11, 2004, p. A25. In New Jersey, a pair of bald eagles nested and hatched an eaglet on a wooded island tucked in between a bustling container shipping port and an abandoned petroleum tank farm. The island is Petty's Island on the Delaware River between Camden, N.J. and Philadelphia. Citgo Petroleum Corporation decided to turn the entire 300 acre island into a nature preserve. But the Democratic government and developers are pushing instead to turn the island into a resort with hotel and golf course, 300 homes and a conference center. Jeff Tittel, executive director of the New Jersey Sierra Club commented, "It's kind of

sad when Democratic elected officials make an oil company look environmentally friendly." (v. 15, # 3)

Koellner, Thomas, and Oswald J. Schmitz. "Biodiversity, Ecosystem Function, and Investment Risk." *BioScience* Vol. 56, no. 12 (2006): 977-85. Biodiversity has the potential to influence ecological services. Management of ecological services thus includes investments in biodiversity, which can be viewed as a portfolio of genes, species, and ecosystems. As with all investments, it becomes critical to understand how risk varies with the diversity of the portfolio. The goal of this article is to develop a conceptual framework, based on portfolio theory that links levels of biodiversity and ecosystem services in the context of risk-adjusted performance. We illustrate our concept with data from temperate grassland experiments conducted to examine the link between plant species diversity and biomass production or yield. These data suggest that increased plant species diversity has considerable insurance potential by providing higher levels of risk-adjusted yield of biomass. We close by discussing how to develop conservation strategies that actively manage biodiversity portfolios in ways that address performance risk, and suggest a new empirical research program to enhance progress in this field.

Koenig, Robert, "The Pink Death: Die-Offs of the Lesser Flamingo Raise Concern," Science 313(22 September 2006):1724-1725. Mass deaths of flamingos seem to be linked to changes in East Africa's lakes, but researchers are still investigating the causes. A likely cause is changes in pollutants and lake levels caused by development. The flamingos nest and feed in alkaline, soda-rich Rift Valley lakes and seem quite sensitive to upsets in the niche they occupy.

Koenig, W. D., "Persistence in Adversity: Lessons from the Ivory billed Woodpecker," Bioscience 55(no. 8, August 2005): 646-647.

Koetsier, Peter, et al., "Rejecting Equilibrium Theory: A Cautionary Note," Bulletin of the Ecological Society of America 71(no. 4, December 1990):229-230. Equilibrium theory and non-equilibrium theory represent two ends of a spectrum with real ecosystems somewhere in between (Steward Pickett). Non-equilibrium theory is trendy, used to polarize ecologists, but may be no more true than equilibrium theory. Often whether one sees equilibrium or non-equilibrium depends on the level and scale of analysis. If density or community structure as a whole is studied, equilibria may appear never to be reached. However, at population levels, species diversity, or community composition, ecosystems may approach a predictable pattern or steady state. The four authors are in biological sciences at Idaho State University. (v.9,#4)

(v10,#4)

Kohak, Erazim, The Embers and the Stars: A Philosophical Inquiry into the Moral Sense of Nature. Chicago: University of Chicago, 1984. Pp. xiii, 269. The author uses his experiences building and living in an isolated mountain cottage as the basis of wide-ranging philosophical reflections. But Kohak is not a disciple of Thoreau; he is not calling for a "return to nature" in the sense of becoming less technological. Rather, like Robert Frost, he is using his "lived experience" of nature to ground fundamental philosophical conclusions about humans and the universe. The claim is made that anyone who lives in nature while "bracketing out" the technological objects of contemporary existence will come to see the order, unity, and harmony of the natural universe with humanity. But there are two problems here: first, it

is not clear how practical environmental decisions can be derived from this reborn consciousness; the book contains little environmental ethics. And second, the argument ultimately rests on each person sharing/living these natural experiences. But ethics should not have to be based on experience. I can refrain from adultery, and know why it is wrong ethically, without having experienced it. I should be able to protect a wilderness-if it is a moral act-also without experiencing it. Nonetheless, an interesting book filled with philosophical speculations from the perspective of phenomenology and personalism. (Katz, Bibl # 1)

Kohák, Erazim, The Green Halo: A Bird's Eye View of Ecological Ethics. Chicago: Open Court, 2000. Czech environmental ethics -- now for everyone! Perhaps the most remarkable of the several introductions to environmental ethics in a growing literature--remarkable both for the unusual career of its author and the multi-dimensional nature of the work. First published in Czech. Kohák fled Czechoslovakia with the coming of the Soviet regime, had a distinguished career at Boston University, living in a one-room rural home without electricity, then returned to his native country after the Soviet collapse, and is on the Philosophical Faculty of Charles University in Prague. This was originally written as an introduction for his students there.

Kohák joins conviction and strategy, although he refrains from prescribing straight forth what we ought to do. He claims only to describe ideas, challenges, problems, opportunities, and invites readers to think for themselves. Readers who accept this invitation will find that conviction and action are inescapable. "Ecology"--the conscious search for long-term sustainable modes of cohabitation of humankind and the Earth--is no longer the hobby of nature lovers. It is the task of humankind and the meaning of our being" (p. 163).

Kohák's life in multiple worlds gives him resources lacking to other environmental philosophers. He knows the naturalists as well as the philosophers. He knows American philosophy with as much facility as European philosophy. In Europe he knows not only British and Western European sources, analytic and continental philosophy; he draws readily from scholars and original sources in Central and Eastern Europe, both those challenging as well as those within the former Soviet ideology. (v.11,#1)

Kohák, Erazim, "Druhy Ekologické Zkusebnosti (Varieties of Ecological Experience)," Filosofický Casopis (Prague) 43(1995):899-919. In Czech. Also published in English: "Varieties of Ecological Experience," Environmental Ethics 19(1997):153-171, and see abstract at that entry. Kohák is in philosophy, Charles University, Prague, and was formerly in philosophy, Boston University. (v.10,#1)

Kohák, Erazim. "Varieties of Ecological Experience." Environmental Ethics 19(1997):153-171. I draw on the resources of Husserlian phenomenology to argue that the way humans constitute nature as a meaningful whole by their purposive presence as hunter/gatherers (nature as *mysterium tremendum*), as herdsman/farmers (nature as partner), and as producer/consumers (nature as resource) affects the way they respond to its distress--as to a resource failure, as to a flawed relationship, or as to a fate from which "only a god could save us." I find all three responses wanting and look to a different experience, that of nature as an endangered species, as the ground for a more adequate response of accepting responsibility for our freedom, with the consequence of imposing ethical limits on the way that humans relate to all being, not to humans alone. Kohák now lives in the Czech Republic, in Prague, associated with Charles University. He is professor emeritus of Boston University. (EE)

Kohák, Erazim. "Speaking to Trees." Critical Review 6 (1992): 371-388. What is the epistemological status of a world within which speaking to trees would appear as appropriate behavior? It would be a world perceived as a community of autonomous beings worthy of respect. Such a world contrasts with the anthropocentric conception of the world as a value-free reservoir of raw materials, but neither worldview can or should claim descriptive accuracy. Both are equally "manners of speaking" and the choice between them must rest on whether they are conducive to ecologically constructive or ecologically destructive behavior. On that basis, speaking to trees is a legitimate, speaking of biomechanisms an illegitimate form of verbal behavior. Kohák is professor of philosophy at Boston University, and also in Prague, Czechoslovakia. (v6,#1)

Kohen, James L., Aboriginal Environmental Impacts. Sydney: University of New South Wales Press, 1995. ISBN 0 86840 301 6. Available in North America through International Specialized Book Services, Portland, Oregon 97213-3644. 503/287-3093. Fax 503/280-8832. \$ 25.00. Kohen argues that the Aboriginal influence on many, but by no means all, of the ecosystems of Australia was profound and that any understanding of the Australian environment must take this into account. He cites many authorities who both agree and disagree with him. The latter typically see climatic change as the major determinant of the structure of the vegetation. He closes with the observation that, nevertheless, the Aboriginals had less impact on the landscape in 50,000 years than the Europeans have in the last 200 years. Kohen is a biologist at Macquarrie University, Sydney. (v7,#4)

Kohler, J., et al., "New Amphibians and Global Conservation: A Boost in Species Discoveries in a Highly Endangered Vertebrate Group," Bioscience 55(no. 8, August 2005): 693-696. Amphibians are characterized both by a strongly increasing number of newly discovered species and by a high degree of decline. The observed increase in species numbers, over 25 percent in 11 years, is largely due to the intensified exploration of tropical areas and the application of more efficient techniques such as bioacoustics and molecular genetics, rather than to the elevation of subspecies to species rank or the distinction of species that were formerly considered synonymous. In the mantellid frogs of Madagascar, the many species newly described between 1992 and 2004 were as genetically divergent as those described in previous research periods, and most had not been collected previously, corroborating the lack of "taxonomic inflation" in this vertebrate class. Taxonomic exploration is still desperately needed to

avoid misinterpretations in global conservation policy.

Kolakowski, Leszek, "On Respect for Nature," in Freedom, Fame, Lying and Betrayal. London: Penguin Books, 1999. Boulder, CO: Westview Press, 1999. Respect for nature is puzzling; it may reside in a lingering sense of the sacred, that God created nature and humans ought to respect it. But "today we are constantly being told to respect nature, because our continued thoughtless devastation of it will ultimately bring about our own destruction. But such claims are an abuse of language. ... It makes no sense to insist, like the ecological slogans that harangue us at every turn, that we must protect and respect nature for its own sake; it is humanity that we must respect. Nature alone, considered apart from the human costs and benefits of its preservation, deserves no respect" (p. 124)

But this logic is difficult to keep. "Often we are happy just to gaze at the various wonders of nature without any thought of the human benefits, amazed at how it is just the way it should be and glad that we are a part of it" (p. 126). It is difficult to find arguments for this too, and equally difficult to say it is unreasonable. In sum, "it may be that by extending our respect to nature we can gain a better understanding of our humanity" (p. 126). Kolakowski is a Polish philosopher, now retired, once expelled from Poland, and sometime visiting professor at various U.S., U.K., and Canadian universities. (v.13, #3)

Kolarsky, Rudolf, "Sblizovani antropocentrickyh a neantropocentrickyh koncepci filosofie zivotniho

prostredi (Reconciling the Anthropocentric and Non-anthropocentric Concepts of Environmental Philosophy)," Filosoficky Casopis 48(2000):717-729. Anthropocentric and nonanthropocentric concepts of environmental philosophy can be brought together not only in environmental policy (B. Norton) and the justification of the moral basis of a just solution of conflicts between people and nature (J. Sterba), but also in clarifying questions of what it means to be a human in an age of environmental crisis. These concepts make it possible to see the environmental crisis as an opportunity for the development of personality (A. Naess, H. Skolimowski, B. Norton, H. Rolston), and to defend the need to speak in the name of endangered natural entities (A. Naess, R. Nash, K. Ott, V. Hála). The possibilities of reconciling these concepts are signaled by reconciling the interest of people with those of other inhabitants of the planet. A main trouble is anthropocentrism with a preconceived idea that only instrumental relations with nature can be justified by philosophy. Kolarsky is with Filosoficky ustav AC CR [Philosophical Institute, Academy of Sciences, Czech Republic], Prague. (v.13, #3)

Kolasa, Jurek and Steward T. A. Pickett, eds., Ecological Heterogeneity. New York: Springer-Verlag, 1991. 332 pages. Volume 86 in the series Ecological Studies. With nearly two dozen contributors. What is ecological heterogeneity (roughly the ecosystem level word for diversity)? Does it differ from complexity? What dimensions need to be considered to evaluate heterogeneity adequately? Can heterogeneity be measured at various scales? Is heterogeneity a part of the organization of ecological systems? How does it change in time and space? What are the causes of heterogeneity and of its change? Philosophers will want to add: What is the value of ecological heterogeneity? One conclusion: "Heterogeneity emerges and disappears with scale. Scale is the window; heterogeneity is a characteristic of the view in it" (p. vi). An introductory problem is "the heterogeneity of heterogeneity" (p. 1). Kolasa is in biology at McMaster University, Hamilton, Ontario. Pickett is in the Institute of Ecosystem Studies, New York Botanical Garden. (v5,#2)

Kolata, Gina, "With Cloning of a Sheep, the Ethical Ground Shifts," New York Times (2/24/97): A1. See also Kirkpatrick Sale, "Ban Cloning? Not a Chance" New York Times (3/7/97): A35. For a useful discussion of the ethical issues, see Jessica Mathews, "Post-Clone Consciousness," Washington Post (3/7/97): A19. For helpful details on the science involved, see Rick Weiss, "Lost in the Search for a Wolf Are Benefits in Sheep's Cloning," Washington Post (3/7/97): A3. Mammal cloning stirs ethics debate. Scottish scientists took a mammary cell from a 6 year-old adult sheep, starved it of nutrients in order to turn off the genes that made it specifically a mammary cell, and then fused this undifferentiated cell with a sheep egg cell whose own DNA had been removed. The result was a sheep genetically identical to the adult donor of the mammary cell. A week later, scientists in Oregon revealed they had produced a pair of rhesus monkeys from cloned embryo cells. Some of the possible uses of this new technology include: Producing cloned herds of prized livestock (excellent meat or milk producers), cloning genetically-altered animals whose human-protein coated organs won't be rejected when transplanted, and cloning humans for various reasons. The cloning work might also help in developing techniques to turn specific genes on and off in order to correct genetic diseases or to genetically enhance people or animals. President Clinton quickly banned federal funding of human cloning research and asked the National Bioethics Advisory Commission to produce a report by June assessing the legal and ethical implications of human cloning research. No U.S. law prohibits human cloning. The scientist who led the team that cloned the sheep said that there is no reason in principle why humans couldn't be cloned, but that "all of us would find that offensive." Others argue that there are times where human cloning might be acceptable. For example, a couple whose baby was dying might want literally to replace the child, or infertile couples desiring children might want to use cloning to insure that their children have good genes. Clinton's view is that "Each human life is unique, born of a miracle that reaches beyond laboratory science. I believe we must respect this profound gift and resist the temptation to replicate ourselves." Bioregional writer and neo-Luddite Kirkpatrick Sale says that "if cloning of human embryos is possible...it will happen." He points to "the technological imperative that is inevitable in a culture built on the myth of human power and the cult of progress." To support this assertion, he quotes two of the developers of the atomic bomb: "When

you see something that is technically sweet you go ahead and do it" (Robert Oppenheimer) and "Technological possibilities are irresistible to man If man can go to the moon, he will. If he can control the climate, he will" (John von Neumann). (v8,#1)

Kolata, Gina, "Tough tactics in One Battle over Animals in the Lab," New York Times, March 24, 1998, B13, B14. Ingrid Newkirk of People for the Ethical Treatment of Animals charges that scientists at Huntington Life Sciences have broken beagles' legs and ripped organs from conscious, squirming animals while testing drugs for Colgate Palmolive. Alan Staple, Huntingdon's president, said PETA had engaged in baseless accusations, harassment, and threats. He sued the group under the Racketeering Influenced Corrupt Organizations Act. (v9,#2)

Kolb, T. E., M. R. Wagner, and W. W. Covington, "Concepts of Forest Health: Utilitarian and Ecosystem Perspectives," Journal of Forestry 92(no. 7, July 1994):10-15. Health is a metaphor for forest condition at the landscape level, borrowed from its primary use with individual organisms, and the extension is sometimes problematic. There are two main approaches: (1) Utilitarian health. The forest has few pests or pollutants, with biotic conditions for growth to meet management objectives. (2) Ecosystem health. The forest has the physical environment, biotic resources, and trophic networks to support productive forests during at least some seral stages; there is a functional equilibrium between supply and demand of essential resources (water, nutrients, light, growing space); there is a diversity of seral stages and stand structures that provide habitat for many native species and all essential ecosystem processes. Forest health needs to be scaled, from trees to ecosystems. A healthy forest will contain numerous unhealthy and dying trees. Mistletoe, a pest that makes a ponderosa pine forest unhealthy on the utilitarian definition, increases the diversity of bird species in the forest and enriches the community. The authors are in the School of Forestry, Northern Arizona University. This whole issue of the Journal of Forestry is on forest health. (v5,#4)

In Finnish with English summary. Kontturi is a docent, University of Joensuu and with the Finnish Association for Landscape Ecology. (v7,#2)

Kopstein Patricia and Salinger, Jim," "The Ecocentric Challenge: Climate Change and the Jewish Tradition," Ecotheology Vol 6 (Jul 01/Jan 02):60-74. bshalom@ihug.co.nz j.salinger@niwa.cri.nz Environmental issues can be examined from an ecocentric or anthropocentric perspective. The latter approach places human, religious and financial values above the values of nature and the universe. Ecocentric perspectives stress the centrality of all ecosystems, their integration, and planetary processes

above any individual or species. Greenhouse gases in the atmosphere have increased by 50%, and are expected to double during the twenty-first century. These are expected to produce unprecedented environmental change that could threaten the integrity of planetary life and systems. Jewish religious tradition views the entire complexity of creation, and commands us not to destroy any part of God's universe. Hence modern ecological sciences and Jewish theology give us both warnings and guidelines to value, sustain, recycle and restore the natural balance. This paper provides an ecocentric integration of the latest discoveries in climate science with 4000 years of Jewish beliefs.

Kopytoff, Verne G., "In Spring, Birds Return to the Salton Sea and Die in Doves," New York Times, March 24, 1998, B 16. Contaminants could leave the Salton Sea worthless to some 380 species of birds. The Salton Sea, 150 miles from Las Angeles, was formed in 1905 and 1906 after the Colorado River burst through a levee and drained into what had been an ancient dry lake bed, 270 feet below sea level. It became a major stop on the Pacific flyway, second only to the Texas coastline in the number of bird species counted there. Now birds are dying in great numbers from epidemics and contaminants, though the links are still under study. (v9,#2)

Korten, David C., When Corporations Rule the World. West Hartford, CT: Kumarian Press, and San Francisco, CA: Berrett-Koehler Publishers, 1995 (a co-publication). 376 pages. "Each day half a million to a million people arise as dawn reaches their part of the world, turn on their computers, and leave the real world of people, things, and nature to immerse themselves in playing the world's most lucrative computer game: the money game." "It is played like a game. But the consequences are real... - a tale of money and how its evolution as an institution is transforming human societies in ways that no one intended toward ends that are inimical to the human interest. It is a tale of the pernicious side of the market's invisible hand, of the tendency of an unrestrained market to reorient itself away from the efficient production of wealth to the extraction and concentration of wealth ... The creation of money has been delinked from the creation of value." "So powerful has this force of money become that some observers now see the hot money set becoming a sort of shadow world government--one that is irretrievably eroding the concept of the sovereign powers of a nation state" (pp.185-187).

"This is a 'must read' book--a searing indictment of an unjust international economic order, not by a wild-eyed idealistic leftwinger, but by a sober scion of the establishment with impeccable credentials. It left me devastated but also very hopeful. Something can be done to create a more just economic order." -- Archbishop Desmond M. Tutu, Nobel Peace Laureate. "Korten is an honest witness to the disastrous betrayal of common people and future generations that is being carried out by corporations, governments, and multilateral banks. He cuts through the loud rhetoric of economic growth and global economic integration to the facts of increasing poverty, inequality, and dependence. I hope that this book is widely read." --Herman E. Daly.

Chapter 21 is "The Ecological Revolution," This revolution, Korten, maintains, "will require transforming the dominant belief systems, values, and institutions of our societies--an Ecological Revolution comparable to the Copernican Revolution that ushered in the scientific-industrial era" (p. 282). Korten was formerly a faculty member of the Harvard University Graduate School of Business, afterward with the Harvard Institute for International Development, afterward Asia regional advisor on development for the U.S. Agency for International Development (USAID). (v.9,#4)

Korthals, Michiel, "Ethical Rooms for Maneuver and Their Prospects Vis-à-vis the Current Ethical Food Policies in Europe," *Journal of Agricultural and Environmental Ethics* 21(2008):249-273. I want to show that consumer concerns can be implemented in food chains by organizing ethical discussions of conflicting values that include them as participators. First, it is argued that there are several types of consumer concerns about food and agriculture that are multi-interpretable and often contradict each other or are at least difficult to reconcile without considerable loss. Second, these consumer concerns are inherently dynamic because they respond to difficult and complex societal and technological situations and developments. For example, because of the rising concern with global warming, carbon dioxide absorption of crops is now attracting public attention, which means that new requirements are being proposed for the environmentally friendly production of crops. Third, there are different types of consumers, and their choices between conflicting values differ accordingly. Consumers use different weighing models and various types of information in making their food choices. Changing food chains more in accordance with consumer concerns should at least take into account the multi-interpretable, dynamic, and pluralist features of consumer concerns, for example, in traceability schemes. In discussing usual approaches such as codes, stakeholder analysis, and assurance schemes, I conclude that these traditional approaches can be helpful. However, in cases of dynamic, pluralistic, and uncertain developments, maintaining some pre-existing evaluating scheme or some clear cut normative hierarchy,

such as codes or assurance schemes, can be disastrous in undermining new ethical desirable initiatives. Instead of considering ethical standards and targets as fixed, which is done with codes and schemes, it is more fruitful to emphasize the structure of the processes in which ethical weighing of relevant consumer concerns get shaped. The concept of "Ethical Room for Maneuver" (ERM) is constructed to specify the ethical desirable conditions under which identification and weighing of paramount values and their dilemmas can be processed. The main aims of the ERM are making room in all the links of the food chain for regulating and implementing the relevant consumer concerns by (1) balancing and negotiating, (2) supporting information systems that are relevant and communicative for various consumer groups and (3) organizing consumer involvement in the links of the food chain. The social and political context of agriculture and food production, particularly in Europe, gives ample opportunity for implementing several types of Ethical Rooms for Maneuver. Finally, I discuss several types of Ethical Rooms for Manoeuvre in the food chains that can be communicated by means of specific traceability schemes to less involved stakeholders with the potential consequence that the stakeholders will be motivated to be more involved. The author is in Applied Philosophy, Wageningen University, Wageningen, Netherlands.

Korthals, Michiel, "The Struggle Over Functional Foods: Justice and the Social Meaning of Functional Foods," Journal of Agricultural and Environmental Ethics 15(no. 3, 2002):315-324. The social and scientific debate over functional foods has two focal points: one is the issue of the reliability and trustworthiness of the claims connected with functional foods. You don't have to be a suspicious person to be skeptical vis-a-vis the rather exorbitant claims of most functional foods. They promise prevention against all kinds of illnesses and enhancement of achievements like memory and vision, without having been tested adequately. The second issue is the issue of the socio-cultural dimension of functional foods and their so called detrimental effect on the social and normative meanings of food, with possibly the effect that food in general will be treated like a medicine, with radical individualizing effects. Finally, individuals would only be allowed to eat what their gene-profile prescribes them. In this paper, it is argued that food is a non-neutral public good that contributes inherently to the identity of vulnerable individuals. It should be treated in a non-neutral, but impartial way. Therefore, politics need to intervene in food markets from a justice and ethical point of view with two aims in mind. The first aim (as an implication of justice considerations) should be to establish safety conditions, and to identify and monitor food safety standards in an objective and impartial way. Preventive medical claims of foods should be allowed on the basis of appropriate and objective testing methods. The second aim (as an implication of ethical considerations) should be to shape conditions for a cohabitation of various food styles, including that of functional foods. Moreover, the cultural and symbolic meaning of food in a pluralistic society requires that the different food styles find some modus of living and interacting together. As long as functional foods comply with safety standards and respect other food styles, they should be allowed on the market, just like any other food product. KEY WORDS: deliberative ethics, functional foods, justice. (JAEE)

Kosek, Jake. *Understories: The Political Life of Forests in Northern New Mexico*. Durham: Duke University Press, 2007. The author finds an underlying racial politics in a self-righteous environmental movement making claims of "stewardship" over natural resources that sustain indigenous people the Hispanos in the Española Valley in New Mexico, extended to marginalized blue-collar people everywhere in the U.S. West.

Koshland, Jr., Daniel E., "The Case for Biodiversity," Science 264(April 29, 1994):639. Tongue-in-cheek satirical editorial by the editor-in-chief of science, that could make a useful class discussion piece. Dr. Noitall has become a defender of all life forms. "And what species are you trying to save now?" "I am becoming the defender of the unpopular little species who have a poor media image--the Mycobacterium

tuberculosis, the Salmonella typhi, the pneumococci, the syphilis spirochete, the AIDS virus, and the malaria parasite. ..." "But those are horrible pathogens that are out to kill humans. Why should you want to be on their side?" "That's typical 'speciesism,' as despicable as racism. We biodiversity people do not limit ourselves to loveable species; all God's creatures deserve to live." "How can humans relate to bacteria and viruses that are basically stupid, without a cerebral cortex and devoid of higher moral concepts?" "Stupidity is in the eye of the beholder. Bacteria survive by swimming toward nutrients that are good for them and away from toxic substances that are bad for them--a simple strategy that Homo sapiens could learn to advantage. Bacteria exchange DNA rapidly to pass drug resistance genes from one bacterium to another, a bacterial Marshall Plan. One DNA transfer provides more information than a modern high school education." They could even help us solve the overpopulation problem. (v5,#2)

Kothari, A., Singh, N., and Suri, S., eds. People and Protected Areas: Towards Participatory Conservation in India. New Delhi: Sage Publications, 1996. 272 pages. \$ 38.00. ISBN 0-8039-9333-1. Current thinking about the role of resident peoples in the management of protected areas, with the conviction that such areas do not (always, or often) have to be "peopleless." The authors generally want to keep resident peoples in protected areas and to engage them in some form of cooperative management, holding this to meet both social justice and environmental goals. The anthology results from a workshop sponsored by the India Institute of Public Administration in 1994. Contributions are uneven in their detail and analytical quality. Kothari is a political scientist who has worked in both academic and activist circles. In the introduction Kothari finds both local problems: how to balance the rights of local communities with the protection of wildlife, and an underlying global problem. Conservation takes place in the context of a global industrial economic system. Conservationists are now active in India. "However, the conservationists and officials who brought in these important measures were a part of the same elite classes which have led India headlong towards ecological ruin" (p. 21). Antagonism between villagers and conservationists misinterprets the problem of protected areas because it neglects the social and economic reasons for ecological degradation, namely the urban industrial economy. Conservationists and local peoples are mistakenly divided against each other instead of united with each other against a common enemy. (v9,#2)

Kouneva, Penka Dinkova, Where Nature and Soul Meet, 1995, Duke University, Ph.D, thesis. 166 pages. A cantata for soprano and baritone soloists, mixed chorus and chamber orchestra. The advisor was Stephen Jaffe. The cantata addresses the relationship between humans and nature. The subject was prompted by two concerns: first, that an attitude of condescension, exploitation and senseless destruction of nature will deepen the present ecological crisis; second, that dualisms such as nature/culture, emotion/reason, matter/spirit, body/soul, historically formative in much of Western culture, result in alienation and division, and in turn, reinforce such an attitude. The underlying poetic premise of the cantata is that the human soul can be fully realized only through a new environmental ethics based on

integration and partnership with nature. The cantata is an attempt to critique, through music and poetic texts, an alienated world view, and to celebrate in song a new environmental ethic. (v.10,#1)

Kovel, Joel, "Reflections on a Dialectical Ecology," in Race, Class, and Community Identity, eds. Andrew Light and Mechthild Nagel (Amherst, NY: Humanity Books, 2000). The overwhelming contribution to the ecological crisis made by the accumulation of capital gives renewed importance to Marxism and places it in a radically new light. It will be necessary however to rethink those aspects of Marxist discourse which have alienated it from ecological movements, namely, a fetish of production and the tendency toward an instrumental view of nature. A possible resolution of this impasse may be found through the rethinking of the theory of dialectic. Once this exercise has been completed a renewed account of the relationship between Marxism and ecological movements can be completed.

Kowalski, Nathan. "Following Human Nature." Environmental Ethics 28(2006):165-183. Any mediation of the humanity-nature divide driven by environmental concern must satisfactorily account for ecologically destructive human behavior. Holmes Rolston, III argues that human cultures should "follow nature" when interacting with nature. Yet he understands culture to necessarily degrade ecosystems, and allows that purely cultural values could legitimate the destruction of nature itself. Edward O. Wilson, meanwhile, argues that culture's evolutionary function is to fit humanity to its niche; culture necessarily follows "epigenetic rules" naturally selected for this purpose. However, because humanity cannot but follow these rules, any human behavior—even (post)modern societies' ecologically catastrophic behavior—is entirely natural. Therefore, Rolston's reconciliation is too weak and Wilson's too strong. Yet the two can be mutually modifying. Rolston's "pure" culture should follow the natural value of human nature; yet, humans must be free to disobey (at their peril) Wilson's epigenetic rules. Humanity thus becomes reconciled to nature by freely following its own nature, which is violated when the wider natural world is treated unnaturally. (EE)

Krajick, Kevin, "Winning the War Against Island Invaders," Science 310(2 December 2005):1410-1413. To make islands safe for rare native species, biologists are mounting increasingly complex campaigns to shoot, trap, or poison exotics. Birds, insects, rats, goats, mongooses, cats, pigs, foxes, rabbits, amphibians/reptiles. It's often working.

Krajick, Kevin, "Methuselahs in our Midst," Science 302(31 October 2003):768-769. Scientists and tree lovers are discovering old-growth trees--and clues to the past--in places where they were long thought to be lost. Often in precipice slopes and talus, and sometimes gnarled and twisted, cedars and oaks may be 500 years old; bald cypress in swamps 1700-2000 years old, white cedars in Canada 1000 years old.

Krajick, Kevin, "The Lost World of the Kihansi Toad," Science 311(3 March 2006): 1230-1232. The Kihansi spray toad lived in a biodiversity hotspot, Kihansi Gorge in Tanzania's remote Udzungwa Mountains, where a great waterfall and cascade produced a perpetual spray. The spray toad had probably the smallest range of any vertebrate, two hectares. In 2000, a hydropower dam cut off 90% of the water and the ecosystem withered. The toad has virtually disappeared, though a few survive in captivity in U.S. terraria, where they are difficult to breed and subject to parasites and diseases. The World Bank funded the dam, and made largely inept efforts to save the toad, with spray systems designed to mimic the waterfall spray, also the sprinklers were not in place when the water was cut off. Tanzania gets one third of its electricity from the dam, and Tanzanians say, "Who cares about the toad; we want our electricity." One remarked that the captive toads were flown to New York in a jet and Tanzanians could not afford to fly in such jets.

Kramer, Steve, "Naturalness and Restoration Ecology," From the Center: A Newsletter, The Center for Values and Social Policy, University of Colorado, Boulder. Vol. 14, no. 1, spring 1998, pages 1-3. Replies to Patrick D. Hopkins, "Value, 'Nature', and Copies of 'Nature,'" earlier in the same newsletter.

Hopkins's arguments that copies are as good as the originals in nature are unpersuasive. Natural objects and their accompanying values cannot be fully restored through human agency, even in principle, much less in practice, although restoration ecology is nevertheless a laudable goal. Nature is created through a process of evolution that is not intentional, deliberative, or teleological. Recognition that the diversity, complexity, and beauty we find in the natural world is not the result of intentional design supports and magnifies its intrinsic values. We stand in awe of a world that is beyond intentional design and construction. Kramer is in philosophy, University of Colorado, Boulder. (v9,#2)

Land Use, Energy and Industrial Modernization: Historical aspects and implications for future development. Natur und Kultur, Vol. 1/2, 2000, pp. 44-61. Abstract: The transformation of the socio-economic energy system, with a substitution of fossil fuels by biomass during the process of industrial modernization was connected with sweeping changes in land use, the agricultural production system and socio-economic biomass metabolism. In this paper an empirical analysis of the development of the human appropriation of net primary production in Austria since the early 19th century in connection with the changes in the socioeconomic energy system is presented. This focus is of interest not only from an environmental history perspective, but also reveals important aspects about possibilities and limitations of a development towards a modern version of a society based on solar energy. Krebs, Angelika, Ethics of Nature: Basic Concepts, Basic Arguments of the Present Debate on Animal

Ethics and Environmental Ethics. Ph.D. dissertation at the University of Frankfurt, Germany. 1993. This thesis is also the concluding report of a project on "Value Systems and Attitudes towards Nature" at the Stockholm Environment Institute, and the thesis will be published by that institute.

Krebs develops a taxonomy of arguments for the value in nature. Part A lists anthropocentric arguments: A1, the instrumental value of nature for satisfying basic human needs; A2, the instrumental value of nature for sensual human delight; A3, the aesthetic intrinsic value of beautiful and sublime nature; A4, the instrumental value nature has for relieving us of "aesthetic responsibility" by its having a form of its own; A5, the role the native landscape plays for the identity or individuality of human beings; A6, the pedagogic value of treating nature with care; and A7, the meaning of life and the intrinsic value or sacredness of the wise person who knows the meaning of life. Part B features a holistic argument, neither purely anthropocentric nor purely physiocentric, that to accord intrinsic value to nature is to further the good life of persons, since humans are part of nature. Part C lists five physiocentric arguments that give reasons why we should respect the good of nature for its own sake: C1, the value of sentient nature; C2, the intrinsic value of teleological nature; C3, respect for life; C4, a higher order of values of or in nature; C5, a theological order of value.

In a critical section, Krebs finds that all anthropocentric arguments are good arguments. The holistic argument (Part B) and all the physiocentric arguments (Part C) are bad arguments, except for C1, C2, and C3 when restricted to certain animals. Except for animal nature, the rest of nature lacks moral or absolute intrinsic value. There is nothing we owe to nonanimal nature itself. Krebs is now Associate Professor at the Faculty of Philosophy, University of Frankfurt, Germany. (v4,#3)

Krebs, Angelika, ed. Naturethik. Grundtexte der gegenwärtigen tier- und ökoethischen Diskussion (Ethics of Nature: Fundamental Texts Discussing Contemporary Animal and Ecological Ethics). Frankfurt: Suhrkamp. April 1997. 400 pages. ISBN 3-518-28862-8. This reader brings together basic readings on the intrinsic value of nature both from the English-speaking and the German-speaking discussion. By translating ten influential English papers it makes them available to a wider German-speaking audience. By including seven important German texts, it attempts to overcome the somewhat imperialistic influence that the English-speaking ethics of nature tends to exert in international philosophical circles. This anthology is only the second systematic reader in German on the ethics of nature, the first having been Dieter Birnbacher's Ökologie und Ethik (Stuttgart, 1980, with articles by Fraser-Darling, Tribe, Rock, Birnbacher, Feinberg, Spaemann, and Passmore). The book has two sections. In the first section on animal ethics Peter Singer, Tom Regan and Ursula Wolf argue for the moral status of animals, while Raymond Frey, Jürgen Habermas and Ernst Tugendhat argue against it. The second section on environmental ethics has Paul Taylor, Stephen Clark, Hans Jonas, Arne Naess, J. Baird Callicott and Holmes Rolston on the "pro" side, and William Frankena, Bernard Williams, Martin Seel, Friedrich Kambartel and Angelika Krebs on the "contra" side. (v8,#1)

Krebs, Angelika, "Haben wir moralische Pflichten gegenüber Tieren?" (Do We Have Moral Duties to Animals?), Deutsche Zeitschrift für Philosophie (Berlin) 41:(1993)6, 995-1008. Subsections: The nature-ethics debate in general; The pathocentric argument in nature-ethics; four objections to the pathocentric argument: (1) The rationalist argument, (2) The formal ethical argument, (3) The "First comes eating, then animals" argument, (4) The "policing nature" argument. Krebs is in philosophy at the Johann Wolfgang Goethe-Universität, Frankfurt/Main. (v5,#1)

Krebs, Angelika, Ethics of Nature: A Map. Berlin/New York: Walter de Gruyter. Perspectives of Analytical Philosophy. 1999. 176 pages. paperback: US\$ 36.00, DM 58,-. ISBN 3-11-015830-2, hardcover: US\$ 96,00, DM 148,-. ISBN 3-11-015829-9. An inquiry into the value of nature: Is nature's value only instrumental value for human beings or does nature also have intrinsic value? It answers this question, first, by clarifying basic concepts such as "nature," "intrinsic value," and "epistemic" versus "moral" anthropocentrism. Second, it develops a critical taxonomy or "map" of thirteen arguments for the conservation of nature and defends the moral intrinsic value of sentient animals, but not of nonsentient

nature. The book refers to an extensive range of publications, in the English and German languages, and also draws on texts, philosophical and literary, that lie outside the recent professional controversies. An effort is made to frame the arguments in a concise, simple, and unladen language. Moral philosopher Bernard Williams of Oxford provides a guest foreword. Krebs is in the faculty of philosophy, University of Frankfurt, Germany. (v.10,#1)

Krebs, Angelika, Ethics of Nature. New York, Berlin: Walter de Gruyter, 1999. With a foreword by Bernard Williams. 162 pages. Paper. In English. The ethics of nature is an inquiry into the value of nature. Is nature's only value instrumental for humans, or does nature also have intrinsic value? Can anthropocentrism be defended or must we move to a physiocentric moral position?

Contents:

Part I. Basic Concepts. Nature. Ethics. Anthropocentrism and Physiocentrism. Pathocentrism: All sentient beings have moral status. Biocentrism: All living beings have moral status. Radical physiocentrism: All of nature has moral status.

Part II. Seven anthropocentric arguments for the value of nature. 1. The basic needs argument. 2. The aisthesis argument: nature is the source of many pleasant sensations and feelings. 3. The aesthetic contemplation argument. 4. The natural design argument. 5. The heimat argument: sense of native inhabited place. 6. The pedagogic argument: human virtues encountering nature. 7. The meaning of life and true joy of living argument.

Part III. A hermaphroditic argument for the value of nature: holistic thinking opposing dualism.

Part IV. Five physiocentric arguments for the value of nature. 1. The pathocentric argument. 2. The teleological argument. 3. The reverence for life argument. 4. The following nature argument. 5. The theological argument.

Between anthropocentrism as instrumental value for nature and physiocentrism as absolute value for nature lie enlightened anthropocentrism and extensionist physiocentrism. Enlightened anthropocentrism accords nature various kinds of eudaemonic intrinsic value, aesthetic intrinsic value, heimat value and sacredness. Extensionalist physiocentrism extends elements of human moral nature, notably respect for the well-being of others, to nature.

The ethics of nature should not be anthropocentric in the instrumentally-truncated sense but neither should it be anthropocentric in the extensional sense. Rather, it should be moderately physiocentric, more precisely, pathocentric. The ethics of nature must, however, remain anthropocentric in the epistemic sense. Those who press for a radical change, a paradigm shift, in our moral attitude toward nature, and brand anthropocentrism as the source of all ecological evil in the world are therefore wrong. We ought to orient our conduct toward nature based on the good of those beings, animal and human, who have a subjective good, who now live, and who will in the future live on Earth.

Krebs is in philosophy at the University of Frankfurt, Frankfurt am Main, Germany. This work expands her 1993 dissertation at the University of Frankfurt, also work at Oxford University and the University of California, Berkeley. (v.10,#2)

Krebs, Angelika, "Discourse Ethics and Nature," Environmental Values 6(1997):269-280. ABSTRACT: The question this paper examines is whether or not discourse ethics is an environmentally attractive moral theory. The answer reached is: no. For firstly, nature has nothing to gain from the discourse ethical shift from monological moral reflection to discourse, as nature cannot partake in discourse. And secondly, nature (even sentient animal nature) has no socio-personal integrity, which, according to discourse ethics, it is the function of morality to protect. Discourse ethics is a thoroughly anthropocentric moral theory. Faculty of Philosophy, University of Frankfurt, Dantestrasse 4-6, 60054 Frankfurt am Main, Germany. (EV)

Krebs, Angelika. "Ökologische Ethik I: Grundlagen und Grundbegriffe." In Angewandete Ethik, pp. 346-85. Ed. Julian Nida-Rümelin. Stuttgart, 1996. (Reprinted in Naturethik, ed. Angelika Krebs

[Frankfurt, 1997], pp. 337-79.) This article presents a critical taxonomy of arguments for the conservation of nature. Six physiocentric and seven anthropocentric arguments are distinguished. The six physiocentric arguments are: pathocentric (sentience-centered), teleological, reverence-for-life, naturam-sequi, theological, and holistic. Krebs argues that only the first is valid. The seven anthropocentric arguments are: basic-needs, aisthesis, aesthetic-contemplation, natural-design, "Heimat," pedagogic, and the meaning of life. All seven, Krebs contends, are valid. Next, Krebs proposes a position that can be described as a rich anthropocentrism in which nature has both instrumental and intrinsic (aesthetic) value, and in which sentient nature has intrinsic moral value (that is, pathocentrism). The task is clear but complex: to develop worldviews and value systems that might improve our chances for ecological survival and a meaningful future development for all life on earth within a global biotic community. One step toward accomplishing this task might be to seek to rediscover the significance of the worldviews and the ultimate values of traditional cultures. We cannot copy or simply take over their worldviews, but we can learn from the ways they perceive their unity with all living beings, and we can learn from the ways they are able to adapt to present life conditions, and from the ways such cultures seek to transform the world so that the human presence will continue to exist for generations along with other forms of life in the biotic community. Kristiansen is at Finnmark College, Follums, Alta Norway.

Kuchar, Catharine Brockman. "An Expansion in the Recognition of Rights: Where Will Nature Find Its Place?" Master of Theological Studies thesis, Emory University, Candler School of Theology, Atlanta, GA, 1996. The basic assumption of this thesis is underscored in the idea that the notion of "human rights" has been expanded over history, from the Magna Carta, the Bill of Rights, the Nineteenth Amendment to the U.S. Constitution, and so on. Working from Roderick Nash's work, *The Rights of Nature: A History of Environmental Ethics*, a next logical step in history might seem to be an expansion toward the environment. Unlike Nash and other advocates of the rights of nature, however, the argument is made that the fundamental understanding of "rights" is inappropriate when looking for a way to protect

the environment. Such talk cannot be transposed to the natural world. Three alternative, value-based approaches to placing "moral boundaries" around the environment are humanistic, naturalistic, and theocentric value. In humanistic values, based on relation to human welfare, the inherent values of nature become lost. Naturalistic value is guided by intrinsic value, but this approach fails to recognize the special role and enormous responsibility of humans in the equation. Theocentric value moves the measure of value from humankind and/or the natural world to God. The best hope for nature is found in the affirmation of its dignity and in an overdue understanding of our own special role as stewards on this planet. The causes and consequences of rare-common differences and an analysis of the processes responsible for the creation and maintenance of interspecific differences more generally. (v8,#3)

Kunkel, H. O. & Thompson, Paul B., "Interest and Values in National Nutrition Policy in the United States", Journal of Agricultural Ethics 1(1988):241-246. This paper examines the case of nutrition policy in the United States, which has been both at the interface between agriculture and medicine and the object of serious discord concerned with the strength and validity of the scientific evidence and the responsibility for action. Our analysis suggests that the tension between libertarian and utilitarian social values of scientists is at least as important as disagreements relative to validity and strengths of the scientific evidence. Kunkel and Thompson are in animal science, philosophy, and agricultural economics at Texas A & M University, College Station.

Kuo, Frances E., and William C. Sullivan, "Environment and Crime in the Inner City: Does Vegetation Reduce Crime?" Environment and Behavior 33(no. 3, May 2001):343-367. Although vegetation has been positively linked to fear of crime and crime in a number of settings, recent findings in urban residential areas have hinted at a possible negative relationship. Residents living in "greener" surroundings report lower levels of fear, fewer incivilities, and less aggressive and violent behavior. This study uses police crime reports to examine the relationship between vegetation and crime in an inner city neighborhood. Crime rates for 98 apartment buildings with varying levels of nearby vegetation were compared. Results indicate that the greener a buildings surroundings were, the fewer crimes reported. This pattern held for both violent crimes and violent crimes. The authors are at the Human Research Laboratory, University of Illinois, Urbana-Champaign. "Securing Economic Benefits and Promoting Conservation through Bioprospecting." *BioScience* Vol. 56, no. 12 (2006): 1005-12. Bioprospecting has frequently been cited as a sustainable use of biodiversity. Nevertheless, the level of bioprospecting in biodiversity-rich tropical regions falls below its potential with the result that bioprospecting has produced only limited economic benefits. We present a bioprospecting program that, in addition to promoting drug discovery, provides economic benefits to and promotes conservation in Panama through the sustainable use of biodiversity. The program was initiated using insights from 20 years of nonapplied ecological research to enhance the likelihood of finding treatments for human disease. Samples are not sent abroad; rather, most of the research is carried out in Panamanian laboratories. Panama has received immediate benefits for the use of its biodiversity in the form of research funding derived from sources outside Panama, training for young Panamanian scientists, and enhanced laboratory infrastructure. Over the long term, discoveries derived from bioprospecting may help to establish research-based industries in Panama.

Kutty, Krishnan, "India: A Wildlands and Recreation Overview," International Journal of Wilderness 3(no. 1, 1997):6-7. India is home to about one third of the known life forms of the world. In colonial India, all forests, wildlife, and other natural resources were the property of the crown. Since independence, there has been meaningful involvement of rural people in the stewardship of wildland, natural, and reforested areas. There were 45 national parks in 1960; there are 450 today. The only areas similar to the American concept of wilderness are in the Himalayas, increasingly visited both by internationals and Indians, often with adverse environmental impact. Kutty is from Bangalore, and runs the National Outdoor Leadership School (NOLS) program in India. (v8,#2)

Kvakkestad, Valborg, Frøydis Gillund, Kamilla Anette Kjølberg and Arild Vatn, "Scientists' Perspectives on the Deliberate Release of GM Crops," *Environmental Values* 16(2007): 79-104. In this paper we analyse scientists' perspectives on the release of genetically modified (GM) crops into the environment, and the relationship between their perspectives and the context that they work within, e.g. their place of employment (university or industry), funding of their research (public or industry) and their disciplinary background (ecology, molecular biology or conventional plant breeding). We employed Q-methodology to examine these issues. Two distinct factors were identified by interviewing 62 scientists. These two factors included 92 per cent of the sample. Scientists in factor 1 had a moderately negative attitude to GM crops and emphasised the uncertainty and ignorance involved, while scientists in factor 2 had a positive attitude to GM crops and emphasised that GM crops are useful and do not represent any unique risks compared to conventional crops. Funding had a significant effect on the perspective held by the scientists in this study. No ecologists were associated with factor 2, while all the scientists employed in the GM-industry were associated with this factor. The strong effects of training and funding might justify certain institutional changes concerning how we organise science and how we make public decisions when new technologies are to be evaluated. Policy makers should encourage more interdisciplinary training and research and they should make sure that representatives of different disciplines are involved in public decisions on new technologies. The authors are at the Norwegian University of Life Sciences, Ås, Norway.

1999):206- . (v.11,#1)

Kverndokk, Snorre. "Tradeable CO2 Emission Permits: Initial Distribution as a Justice Problem." Environmental Values 4(1995):129-148. One characteristic of tradeable emission permits is that efficiency and justice considerations can be separated. While Pareto optimality is an accepted efficiency principle, there is not a consensus on a 'best' equity principle. In this article, conventional justice principles are used to evaluate alternative allocation rules for tradeable CO2 permits, and a distribution proportional to population is recommended. Arguments against the population rule are discussed, especially those pertaining to political feasibility. While justice and political feasibility may indeed contrast, it still may be possible to emphasise the population rule in the future. KEYWORDS: Global warming, tradeable emission permits, justice principles, political, feasibility. Kverndokk is in statistics research, Oslo. (EV)

Kwame, Safo, ed., Readings in African Philosophy: An Akan Collection. Lanham, MD: University Press of America, 1995. (v6,#3)

KwaZulu Conservation Trust, "An African Dilemma: Conservation Must Be Balanced by Human Needs," Financial Mail (South Africa), November 23, 1990, pp. 57-75. A sensitive study of the tradeoffs between wildlife conservation and the needs of the poor, largely blacks, in South Africa. Focuses on KwaZulu, the land of the Zulu, a self-governing yet non-independent state made up of fragmented chunks of the province of Natal, carved out by the vagaries of colonial and subsequent apartheid politics. This is also a region of spectacular wildlife, with some of the principal designated conservation areas in South Africa. The blacks, although often on their own original lands, have been marginalized from white society, have seriously overpopulated, and do not always make intelligent use of their own lands (for example their large numbers of cows used as status symbols). Many examples are given of how blacks can derive income and sustainable harvest from reserved lands, with continuing populations of wildlife. In this region, more than elsewhere in South Africa, blacks have been incorporated into the professional personnel of wildlife management. A good contact on these matters is Wayne Elliott, P. O. Box 145, Melmoth 3835, South Africa, who is a white South African employed as a professional wildlife manager by the black KwaZulu government. (v2,#1)

Kwiatkowska-Szatscheider, Teresa. "From the Mexican Chiapas Crisis: A Different Perspective for Environmental Ethics." Environmental Ethics 19(1997):267-278. The social unrest in Chiapas, a southern Mexican state, revealed the complexity of cultural and natural issues behind the idealized Western version of indigenous ecological ethics and its apparently universal perspective. In accordance with the conventional interpretation of traditional native beliefs, they are often pictured as alternative perspectives arising from challenges to the scientific worldview. In this paper, I point toward a more comprehensive account of human-environmental relation rooted in the particular type of social and natural conditions. I also discuss changes of place, changes of identity related to changes of place, and respective changes in modes of environmental sustainability. I conclude that modernization endangers two fundamental ethical insights: "openness" to the environment and respect for nonhuman living beings. Kwiatkowska-Szatscheider is in philosophy at the Universidad Autonoma Metropolitana-Iztapalapa in Mexico. (EE)

Introduction by Jorge Issa

Holmes Rolston III, *Environmental Ethics, Values in and Duties to the Natural World.*

Kwiatkowska and Issa both teach philosophy at the Universidad Autonoma Metropolitana-Iztapalapa, Mexico City. (v9,#1)

Kwiatkowska, Teresa, and Wilchis, Ricardo Lopez, "Critical Reflections on the 'Ethics of Integrity' (Reflexiones criticas sobre la 'etica de la integridad') Contactos no.27, May-June 1998. The article revises the use of some ecological concepts like ecosystem and biodiversity within the ethical environment. It deals as well with the concept of nature preservation with little or no human influence. The modern understanding of environmental conservation implies the management of natural resources defined as a design of ecosystems for the mutual benefit of humans and nature. The integrated approach that includes human society and natural systems permits the attainment of social goals and evolutionary potential of natural ecosystems. (v.9,#3)

LaBossiere, Michael, "Body and Environment." Environmental Ethics 16(1994):411-418. My thesis is the biconditional that it is morally wrong to pollute human bodies if and only if it is morally wrong to pollute the environment. The argument for each conditional is by analogy: pollution of one type is analogous to pollution of the other type in morally relevant respects. I argue that the truth of the biconditional makes it difficult to maintain that it is morally wrong to pollute human bodies without maintaining that it is morally wrong to pollute the environment and conversely. LaBossiere is with the Dept. of Visual Arts, Humanities, and Theatre, Florida Agricultural and Mechanical University, Tallahassee. (EE)

Lackey, R.T. "Science, Scientists, and Policy Advocacy." *Conservation Biology* Vol. 21, no. 1 (2007): 12-17. Terms such as "degradation," "good," and "healthy" convey values. There is no objective definition of ecosystem health, so any chosen baseline reveals preferences and worldview. These will covertly suggest policy preferences. But advocating policy should be avoided. Stated conflicts of interest will reveal these hidden agendas.

Lackey, Robert T., "Seven Pillars of Ecosystem Management," The Environmental Professional 17, no. 4 (1995): (in press). The seven pillars are: 1) the continuing evolution of social values and priorities; 2) place-based, necessitating clearly defined boundaries; 3) achievement of social benefits; 4) ecosystemic stress factors; 5) biodiversity, which may or may not be a factor; 6) "sustainability," if used as a concept in management, needs to be clearly defined; and 7) scientific information is important but only one element in decision-making, which is fundamentally one of public or private choice. (v6,#2)

Lackey, Robert T., "Ecosystem Health, Biological Diversity, and Sustainable Development: Research That Makes a Difference," Renewable Resources Journal (1995) (in press). Addressing important policy problems and being reasonably likely to be achievable scientifically are the criteria for selecting research. Research especially needed today is: 1) credible procedures to determine ecosystem health, 2) scientific bases for legislation regarding biodiversity and endangered species, and 3) a clear understanding regarding the interrelationship of ecosystem stability, biodiversity, and such external stress as habitat alteration (including development) and harvesting biotic resources. (v6,#2)

Lackey, Robert T., "Ecological Risk Assessment," Fisheries 19, no. 9 (September 1994): 14-18. Risk assessment is used by the scientific elite as a tool to impose their values on the public in the guise of scientific objectivity. The affluent drive the decision-making process of managing and protecting ecological resources. Ecosystem "health" is a strictly anthropocentric notion, and risk assessment will likely be perceived as a form of ecological triage. Lackey is deputy director of the EPA's Environmental Research Laboratory in Corvallis, OR, USA, and holds a courtesy professorship in wildlife and fisheries at Oregon State University. This paper, nor the ones that follow, do not reflect EPA policy positions. (v6,#2)

Lackey, Robert T. "Science, Scientists, and Policy Advocacy." *Conservation Biology* Vol. 21, no. 1 (2007): 12-17. "To scientists, I say get involved, but play the appropriate role. If you choose to advocate your personal policy preferences, make it clear to everyone involved that you have stepped out of a scientific role and into the role of policy advocate."

Ladkin, Donna, "Does 'Restoration' Necessarily Imply the Domination of Nature?" Environmental Values 14(2005):203-219. 'Restoration' is a contested term holding important implications for public policy decisions in the areas of land development and use. A number of environmental philosophers including Eric Katz and Robert Elliott have argued against 'restoration', on the principle that human efforts can never restore natural landscapes to their pre-disrupted value, and that the assumption of our ability to do so implies 'domination'. This paper argues that restoration attempts should not be dismissed 'out of hand', and can be conducted outside of a 'dominator logic' provided four criteria are enacted: 1) humans see their role as co-creators working alongside nature, 2) the aim of restoration is seen to be increase of land health and bio-diversity 3) there is a commitment to learning from the land and 4) the land's own 'projects' (Plumwood) are taken into account. Ladkin is in the Centre for Leadership Studies, University of Exeter, UK. (EV)

Lafferty, Mike, "Bugsicles," Polar Times, January 2005, p. 9. The tiny Antarctic midge, Belgica antarctica, spends 22 of its 24 month life cycle encased in ice and with most of its own interior frozen. And when the ice melts, it dries out and looks dead, black and wrinkled, something like a quarter inch raisin. Yet this is the continent's largest land animal. (Biologists count the penguin as a marine animal.) Small in size, this is a super-bug, because it can take almost anything that nature throws at it, super-cold, super-dry, super-salty water, or fresh water, and super acidic to super alkaline conditions. The midge exemplifies life in extremes. Story first appeared in the Columbus Dispatch, September 21, 2004.

"Jean-Jacques Rousseau particularly deserves recognition by environmentalists for a complex view of man's relation to nature which greatly influenced the Romantic viewpoint." LaFreniere teaches environmental studies at Willamette University, Salem, Oregon. (v2,#1)

Lai, Karyn L. "Conceptual Foundations for Environmental Ethics: A Daoist Perspective." Environmental Ethics 25(2003):247-266. and plausible account of environmental holism. Dao refers to the totality of

particulars, including the relations that hold between them, and the respective roles and functions of each within the whole. De refers to the distinctiveness of each particular, realized meaningfully only within the context of its interdependence with others, and its situatedness within the whole. Together, dao and de provide support for an ethical holism that avoids sacrificing individuals for the sake of the whole. The integrity and stability of the whole are important not because the whole is an end-in-itself but because those conditions assist in preserving the well-being of the constituent parts. In other words, the ethical holism supported in the Daodejing does not present individuals and wholes in mutually exclusive terms, but sees them in symbiotic relation, allowing for events to be mutually beneficial, or mutually obstructive, to both. In addition, two other Daoist concepts, wuwei (non-action) and ziran (spontaneity), provide further support for this construction of holism. If the distinctiveness of particular individuals is valued, then unilateral or reductive norms which obliterate such individuality are inappropriate. In this regard, the methodology of wuwei allows for the idea of individuals developing spontaneously in relation to others. According to this view of holism, individuals manifest and realize their integrity in relation to others in the environmental context, achieving an outcome that is maximally co-possible within those limits, rather than one that is maximally beneficial only for particular individuals. Advocacy vs. objectivity in environmental reporting. Does "newsworthiness" distort environmental reporting? Do complex ecological, political, economic, and social issues have to be oversimplified for the media? Articles by journalists and others, including Jim Detjen, Philadelphia Inquirer reporter and president of the Society of Environmental Journalists. (v2,#3)

Lamb, David, Peter D. Erskine, and John A. Parrotta, "Restoration of Degraded Tropical Forest Landscapes," Science 320 (9 December 1005): 1628-1632. The current scale of deforestation in tropical regions underscores the urgent need for interventions to restore biodiversity, ecological functioning and the supply of goods and services previously used by rural poor communities. Traditional timber plantations have made only minor contributions to fulfilling most of these other objectives. New approaches to reforestation with great potential are now emerging. Lamb and Erskine are with the Rainforest Cooperative Research Center and School of Integrative Biology, University of Queensland, Brisbane, Australia.

Lamb, David. "Animal Rights and Liberation Movements." Environmental Ethics 4(1982):215-33. I examine Singer's analogy between human liberation movements and animal liberation movements. Two lines of criticism of animal liberation are rejected: (1) that animal liberation is not as serious as human liberation since humans have interests which override those of animals; (2) that the concept of animal liberation blurs distinctions between what is appropriate for humans and what is appropriate for animals. As an alternative I offer a distinction between reform movements and liberation movements, arguing that while Singer meets the criterion for the former, a higher degree of autonomy and communicative competence is necessary for the latter. In the final section, objections to the possibility of an autonomous animal liberation movement are met by rejecting assumptions concerning the illogicality of interspecies communication. Lamb is in the department of philosophy, University of Manchester, Manchester, England, UK. (EE)

Lamb, David. Review of Ethics and Animals. Edited by Harlan B. Miller and William H. Williams. Environmental Ethics 6(1984):373-76.

Lamb, Kara Lee, From Philosophy to Policy: Is There a Missing Link in Environmental Ethics?, M.A. thesis, Colorado State University, summer 1998. Environmental ethics is often thought to restrict permissible environmental activities by introducing various duties, responsibilities, and prohibitions with which environmental policy and the public must comply. Rather, environmental ethics can and ought enlighten policy by providing a more adequate philosophical grounding in value for legislation. The National Environmental Policy Act (NEPA), though it requires an Environmental Impact Statement, leaves deeper value questions untouched, and leaves agencies with conflicting goals often at cross purposes. Environmental ethics can clarify these value questions. Despite its many insights, however, environmental ethics itself contains conceptual conflicts which reduce its capacity effectively to link with environmental policy. Three proposals for making environmental ethics more effective are based on the work of Val Plumwood, Paul Taylor, and Holmes Rolston. Lamb has a position with the U. S. Bureau of Reclamation interpreting environmental policy to the public and overseeing the public participation process in evaluating that policy. (v9,#2)

Lamb, Kara L., "The Problem of Defining Nature First: A Philosophical Critique of Environmental Ethics," The Social Science Journal 33 (no. 4, 1996):475-486. Before we can decide about the proper

ways to conserve nature, we need an accurate idea of what nature is. Subjectivists vs. objectivists, anthropocentrists vs. biocentrists, conservationists vs. preservationists are at odds over what they value in nature because they perceive and conceive nature differently. Some suggestions for solutions, based on the work of Val Plumwood and Holmes Rolston, involving an analysis of how to pass from what nature is to what ought to be in nature. Lamb is a graduate student at Colorado State University. (v.7,#4)

Ten guiding principles to guide an ecological consciousness, with each of these used to reinterpret the primary locus of productivity as Earth. Lambert is with Productivity Breakthrough, Inc., in Scarsdale, NY. (v3,#4)

Lambert, Richard. "The Earth: The Business of the Future--From EGO Energy to ECO Energy." Population and Environment 19, no. 1 (1997): 95-107. Two distinctions are offered that together provide a new form of reference for bonding the human and the Earth: (1) the difference between the emerging domain of ego energy and the yet to be discovered domain of eco energy; and (2) the difference between looking-at and seeing. These two sets of distinctions are then sounded, like echo chambers, against ten guiding ecological statements. The result is a "turn-around perspective": a different vision to be operationalized in individual, community, and business lives. Now seeing clearly, people can respond with eco energy worth of commitment to "the Earth: the Business of the Future." (v8,#3)

Landman, Willem A. "Moral Standing, Value and Environmental Ethics." South African Journal of

Philosophy 14 (# 1, February 1995): 9-19. How should an environmental ethic be grounded? An answer involves a commitment to a criterion of moral standing and its application, and a wider commitment to a taxonomy of the senses of "value" that inform our relationship with nature. I begin by mapping the different environmental philosophies in order to contextualize my argument. After an analysis of the concept of moral standing I analyze why being a person is a sufficient condition of moral standing. I defend sentience as a condition of moral standing that is not only sufficient but also necessary, and I set out the taxonomy of the senses of "value" that informs a sentience-based environmental ethics. I reject life as a criterion of moral standing and the value commitments of a life-based environmental ethic. I end with some remarks that a sentience-based environmental ethic might be inadequate if we should lose our aesthetic and spiritual sense. Landman is in philosophy at the University of the Western Cape, Private Bag X17, Bellville 7535, Republic of South Africa. (v6,#1)

Landres, Peter, Shannon Meyer, and Matthews, Sue, "The Wilderness Act and Fish Stocking: An Overview of Legislation, Judicial Interpretation, and Agency Implementation," Ecosystems 4(2002)287-295. Many high-elevation lakes in designated wilderness areas are stocked with native and non-native fish to provide recreational opportunities, sometimes in waters that originally had no fish. There is a long-standing controversy about the extent to which this compromises other wilderness values. Landres and Meyer are with the Aldo Leopold Wilderness Research Institute, Rocky Mountain Research Station, USDA Forest Service, Missoula, MT); Matthews is with the Arthur Carhart National Wilderness Training Center, US Fish and Wildlife Service, Missoula, MT. This issue of Ecosystems is a theme issue on fish stocking impacts to mountain lake ecosystems.

Landscape and Urban Planning invites both subscriptions and papers. This is an international journal of landscape ecology, landscape planning, and landscape design. They ask for papers in environmental psychology, conservation biology, and ethical and policy issues posed by nature and human use of land. The editor-in-chief is J. E. Rodiek, College of Architecture, Texas A & M University, College Station, TX 77843-3137. The publisher is Elsevier Science. (v8,#1)

Lang, Berel. "Earthquake Prediction: Testing the Ground." Environmental Ethics 5(1983):3-19. The occurrence of earthquakes is usually ignored or discounted as an environmental issue, but the environmental relevance of the science of earthquake prediction is demonstrable. The social consequences of such predictions, when they are accurate, and even (once a general pattern of accuracy has been achieved) when they fail, have implications of such varied environmental issues as land-use control, building codes, social and economic costs (for predictions made when no earthquake occurs or for failures to predict earthquakes which do occur). Lay members of the public are more directly

involved in programs of earthquake prediction than in almost all other instances of scientific prediction, if only because the scientific findings require public participation in order to have any effect at all. Attention must be paid, accordingly, to the effect of specific public and social values on the practice of earthquake prediction--ranging from such broadly based ones as conceptions of the general relation between man and nature to narrower ones like the cost-benefit analysis of a program of earthquake prediction itself. Because of the close connection between the efficacy of earthquake prediction and public attitudes, moreover, certain questions concerning the social character of "normal" science and the deprofessionalization of scientific institutions are highlighted in this context. Lang is in the department of philosophy, University of Colorado, Boulder, CO. (EE)

Lang, Erin R., "Applying Ethics to Engineering," Journal of Professional Issues in Engineering Education and Practice 129(no. 3, 2003):134-136. Features environmental ethics in civil engineering. "This theory of treating animals and the environment with moral consideration was one of the great evolutions impacting the civil engineering profession over the past decades." The American Society of Civil Engineers sponsors an annual student essay contest. In 2003 the theme was ethics in engineering over the past 150 years. This was one of five prize winning student essays. Lang is a student in civil engineering at the University of Pittsburgh at Johnstown.

Lang, Graeme, "Forests, Floods and the Environmental state in China", Organization and Environment, 15, (No. 2, 2002): 109-30. Deforestation continues in developing countries, despite predictions of ruinous consequences in the 21st century. The state is a poor protector of the environment in most of these countries but is the only agency able to deal with many of the causes of deforestation. This article focuses on the most striking example of state action against deforestation among the developing countries of the world during the past two decades – the ban on logging by the central government of China following the massive floods in 1998. River floods are more devastating in China than anywhere else in the world. This case provides a good opportunity to study state responses to environmental crisis. It illuminates the conditions under which central governments can act forcefully to conserve natural resources in the face of the determination of regional and local actors and authorities to exploit their resources intensively in the drive for economic development. Lang is an associate professor of sociology in the Department of Applied Social Studies at City University of Hong Kong. (v.13, #3)

Lang, Reg and Sue Hendler, "Environmental Ethics: Ethics and Professional Planners," in Don MacNiven, ed., Moral Expertise: Studies in Practical and Professional Ethics (London: Routledge, 1990). Langford, Dale J., et al (8 others), "Social Modulation of Pain as Evidence for Empathy in Mice," Science 312(30 June 2006):1967-1970. Mice observing a cagemate in pain seem to empathize when the cagemate is given a noxious stimulus. They develop a "writhing test." With commentary, Miller, Greg, "Signs of Empathy Seen in Mice," Science 312(30 June 2006):1860-1861, and photo of "commiserating mice." With letter of concern by Ernest Gwynn Jordan, "Mice, Pain, and Empathy," Science 314 (13 October 2006):253, asking whether when ethical scientists see mice commiserating with each other in pain, it isn't time to stop the experiment. The Miller commentary starts: "Empathy is one of the nobler human attributes." Jordan asks: "Must I conclude that it is absent or suppressed in some scientists?" With reply by Jeffrey S. Mogil, one of the authors of the paper, that it is better for mice to suffer than people, and their research might reduce human suffering by learning how commiseration can reduce pain in humans, and that they choose to test with the least pain possible to remain effective in the experiment. So: On with the experiments. The authors are in psychology, McGill University, Montreal.

Langford, Dale J., et al, "Social Modulation of Pain as Evidence for Empathy in Mice," Science 312(30 June 2006):1967-1970. Mice are found to exhibit enhanced pain sensitivity when they see a familiar fellow cagemate experience pain, but not when the other mouse is a stranger. For example, they hop off a heated area of the cage floor faster. There is "emotional contagion," a primitive kind of empathy that does not require understanding what others are experiencing. The information may be transmitted in part through chemical signals, but seems mostly transmitted by vision. Langford and his research team are in psychology, in a center for research on pain, at McGill University, Canada.

Langhelle, Oluf, and Ornulf Seippel, "Norsk miljøfilosofi, en basis for en alternativ ideologi: Sigmund Kvaloy Satereng," Tidsskrift for Alternativ Framtid (The Norwegian) Journal for an Alternative Future, no. 2, 1993. One in a series of philosophically relevant articles presenting profiles in Norwegian environmental philosophy, this one presenting and discussing Satereng's ecophilosophical platform, with a response by Satereng in the subsequent issue. Satereng is a farmer-writer-lecturer in Norway who has developed a variety of deep ecology drawing on Mumford, Bergson, Whitehead, and Naess, a strong critic of the industrial growth society. Langhelle and Seippel are research fellows at the Alternative Futures Project, Oslo. (v5,#4)

Langhelle, Oluf. "Sustainable Development and Social Justice: Expanding the Rawlsian Framework of Global Justice." Environmental Values 9(2000):295-323. ABSTRACT: This article makes two arguments. First, that social justice constitutes an inherent part of the conception of sustainable development that the World Commission on Environment and Development outlined in *Our Common Future* (1987). The primary goal of the Commission was to reconcile physical sustainability, need satisfaction and equal opportunities, within and between generations. Sustainable development is what defines this reconciliation. Second, it is argued that this conception of sustainable development is broadly compatible with liberal theories of justice. Sustainable development, however, goes beyond liberal theories of justice in many respects. It is based on three assumptions, which are for the most part ignored in liberal theories: an accelerating ecological interdependence, historical inequality in past resource use, and the 'growth of limits'. These assumptions create a conflict between intra - and intergenerational justice, which is ignored in liberal theories, but which sustainable development tries to solve. It does so by imposing duties on developed countries that goes beyond liberal demands, and by abandoning the focus 'solely on protection' that dominates non-anthropocentric approaches to environmental sustainability. Keywords: Biological diversity, climate change, global justice, sustainable development. Oluf Langhelle is at RF - Rogaland Research, P.O. Box 2503 Ullandhaug, 4091 Stavanger, Norway.

Central Africa's dense humid forests have long been regarded as among the most pristine on Earth, but in recent decades industrial logging has become the most extensive form of land use in the region.

Lappé, Frances Moore, Collins, Joseph, and Rosset, Peter, World Hunger: Twelve Myths, 2nd ed. New York: Grove Press, 1999. \$ 11.00. The twelve myths:

1. Not enough food to go around.
2. Nature's to blame for famine.
3. Too many people.
4. The environment vs. more food?
5. The green revolution is the answer.
6. We need large farms.
7. The free market can end world hunger.
8. Free trade is the answer.
9. Too hungry to fight for their rights.
10. More U.S. aid will help the hungry.
11. We benefit from their poverty.
12. Curtail freedom to end hunger? (v.10,#1)

Larkin, Lucy, "Turning: Face-to-face with Limobius mixtus," Ecotheology Vol 7 (No. 1, July 2002):45-59. This article elaborates on the themes of creativity, compassion and new forms of relating in regard to human encounters with nature. The example of an endangered weevil, Limobius mixtus, is put forward to argue that the loss of biodiversity results in the diminishment of God. Emmanuel Levinas' use of the image of 'the face' that comes from 'height', Martin Buber's philosophy of 'I and Thou' and feminist theological writing on the breakdown of relationship are all employed in the weaving of a theological tapestry. Sin is defined as the failure to observe one of the 'least', such as the weevil. Our motives in desiring repaired relationships with nature are additionally scrutinised. It is suggested that to be creative, compassionate and to desire right relationships with nature promote a dynamic which ultimately preserves the life of God.

Larrère, Catherine, Les philosophies de l'environnement (Philosophies of the Environment). Paris, Presses universitaires de France, 1997. 124 pages. An overview of largely American environmental philosophy, with discussions of intrinsic value, the land ethic, animal ethics, wilderness and pluralism. Larrère depicts the American environmental debate as involving two opposed tendencies, the search for abstract universal laws (Moralität), and the effort to ground environmental values in the concept of community (Sittlichkeit). The first is an expanded Kantianism, and also found in the animal rights movement. The second is developed in Leopold's land ethics. Catherine Larrère is a philosophy professor and head of the philosophy department at the Université Michel de Montaigne, Bordeaux III, in France. Reviewed by Pete A. Y. Larrère, Catherine and Raphaël Larrère, Du bon usage de la nature. Pour une philosophie de l'environnement (On the Good Use of Nature: Toward a Philosophy of the Environment). Paris. Aubier, 1997. 355 pages. Much longer than the preceding survey, covering the history of Western philosophy and concluding with the authors' proposal for a plausible and workable environmental ethic. A classical (Greek) view of nature recommended that humans learn from the norms of nature and accept natural limits. The modern world makes nature a realm of passive mechanical interactions, valueless, with humans outside and over nature. The authors, in a third, postmodern view, inscribe humans in nature but not in a privileged position. "Good use today should be ecocentric" (p. 19). Against Luc Ferry, The New Ecological Order, the authors argue that "to face the environmental crisis we do not need only an ethics of responsibility towards future generations but also a new idea, or scientific, ecocentered vision of nature." Shows that environmental ethics is alive and well in France, and also introduces French and European contributions to the debate with which English-speaking philosophers may not be familiar. Catherine Larrère teaches philosophy at the Université Michel de Montaigne, Bordeaux III, in France. Larsen, Randy, Environmental Virtue Ethics: Nature as Polis. M. A. thesis at Colorado State University, Spring 1996. Virtue ethics, developing the Aristotelian tradition, has promise for environmental ethics, although Aristotle's list of virtues needs to be supplemented with environmental ones. "Tenacity" can serve environmentalists, avoiding extremes of "apathy" and "obsession," finding a balance between the existential experience of nature and advocacy for environmental conservation. John Muir is an example of a successful holder of this environmental virtue. Larsen is currently the host on a radio talk show, "Ecotalk," on station KZFR serving the area around Chico, California. He teaches in a community college there. (v6,#4)

Larson, Brendon M. H. "The Social Resonance of Competitive and Progressive Evolutionary Metaphors." BioScience Vol. 56, no. 12 (2006): 997-1004. Metaphors of competition and progress have played a key role in the scientific conception and public understanding of evolution. These scientific and public aspects have been in continual tension, however, since these metaphors have been broadly interpreted in the social realm despite scientists' attempts to isolate their meaning. To examine how this occurs, I conducted a Web survey of evolutionary biologists (Society for the Study of Evolution), evolutionary psychologists (Human Behavior and Evolution Society), biology teachers (National Association of Biology Teachers), and members of a Teilhardian spiritual organization (Foundation for Conscious Evolution) (N = 3D 1892 respondents). Respondents were asked to evaluate the scientific and social dimensions of 18 evolutionary statements with metaphorical elements, including arms race, complexity, cooperation, drift, intelligent design, progress, selfish gene, sperm competition, and struggle for survival. The responses generally confirmed the demise of a progressive view of evolution, whereas competitive metaphors remained popular even though respondents indicated that they had a negative social resonance. The survey reveals how biological metaphors retain connections to everyday understanding, which has implications for teaching biology and for thinking about how biologists may unwittingly endorse particular social policies with their metaphors.

Latour, Bruno, Politics of Nature: How to Bring the Sciences into Democracy. Cambridge, MA: Harvard University Press, 2004. Latour, the controversial deconstructor (social reconstructor) of science now constructs his environmental ethics, or at least, environmental policy. Latour's argument, as usual, is complex and idiosyncratic. The dichotomy between nature and society, between the world and our representations of it, is false. There is no separation between science and nature, for nature is itself a concept that results from certain kinds of scientific and social framings. So, for that matter, are science and society. These concepts are interdependent and must be understood collectively. There is a real world, but it is not "out there."

To address ecological damage and destruction, we have first to acknowledge and then reject the false separations we have heretofore accepted. That means most environmental movements have been wrong. "Under the pretext of protecting nature, the ecology movements have also retained the conception of nature that makes their political struggles hopeless. Because 'nature' is made ... precisely to eviscerate politics, one cannot claim to retain it even while tossing it into the public debate." Latour proposes replacing this bifurcated world with a collective based on civil collaboration between humans and nonhumans.

Meanwhile Latour seems also to hold that in this collective collaboration, nonhumans have to be considered equally with humans. We must extend Kant's categorical imperative to treat the nonhuman world as ends rather than means. We have to take seriously the needs, interests, desires of nonhumans. But just how we know these nonhuman values "out there" without constructing them is left unclear. Reviewed by Naomi Oreskes, "A Call for a Collective," Science 305(27 August 2004):1241-1242. Latour, Bruno, We Have Never Been Modern. Cambridge: Harvard University Press, 1993. 157 pages. paper. Only the modern West has conceptually separated culture from nature; no other cultures have ever done so. That is, in fact, the defining characteristic of modernity: "it believes in the total separation of humans and nonhumans" (p. 37). "Our own mythology consists in imagining ourselves as radically different" (p. 114). At the same time we in the West construct massive "hybrids" of culture and nature--the ozone hole, global warming, deforestation--and are unable to recognize the root of the problem because our ideology, driving science, technology, and politics, separates humans from nature when in fact they must and do entwine. In achieving this separation, "no one has ever been modern. Modernity has never begun. There has never been a modern world" (p. 47) "It behooves us to ... become once more what we have never ceased to be: amoderns" (p. 90). The answer is not in being postmodern, but in being amodern (p. 131). This will retain "the premoderns' inability to differentiate durably between the networks and the pure poles of Nature and Society" (p. 133). Pure culture does not exist, nor does pure nature, nor is anything singular. "There are only natures-cultures" (p. 104). Latour is a sociologist at Ecole Nationale Supérieure des Mines, Paris, and at the University of California, San Diego. (v7,#2)

Lautensach, Alexander K. Environmental Ethics for the Future. A thesis submitted for the degree of Doctor of Philosophy at the University of Otago, Dunedin, New Zealand, September 2003. ABSTRACT: Over the last few decades mounting evidence has suggested that the Earth is facing an environmental crisis unprecedented in its scale and causation. The crisis threatens the continued well-being of humanity as well as much of the biodiversity of the planet. It is largely caused by unsustainable behaviour of Homo sapiens. Underlying human behaviour are beliefs, values and structural constraints that shape people's concepts of progress. The emerging global culture manifests a particular concept of progress that is based on harmful beliefs and largely counterproductive values. Within that value base, the counterproductive influences tend to arise from anthropocentric values and assumptions, which are incompatible with sustainable living. The most effective approach to accomplish a cultural change of such magnitude is through educational reform. This thesis provides an educational blueprint for changing those anthropocentric values and assumptions and to introduce a moral shift towards ecocentrism. A large-scale reform at many levels of current educational practice is required to ensure that learners acquire the moral, scientific, interpretive and emancipatory knowledge to build a sustainable future for humanity and its home.

Lautensach, Alexander K., "The Values of Ecologists," Environmental Values 14(2005): 241-250. The popular stereotype of ecologists appears somewhat at odds with the ideal of the objective, detached, morally disinterested researcher. Ecologists tend to subscribe to this ideal, as do most natural scientists. This puts the stereotype into question. To what extent and in what respects can ecologists be regarded as motivated by environmentalist values? What other values might contribute to their motivations? The answers to those questions have bearing on how policy makers perceive the input they receive from ecologists and it has long-term implications for the funding of ecological research. To obtain some answers I analysed over fifty randomly selected publications of ecologists for explicit and implicit value statements. The analysis revealed an abundance of value statements. However, no bias was evident towards a conservationist or ecocentric environmental ethic such as suggested by the stereotype. I will suggest some explanations and ramifications of these results that take into account the ecologist's professional situation. Lautensach is in biology, University of Auckland, New Zealand. (EV)

Lea, David R., "Melanesian Axiology, Communal Land Tenure, and the Prospect of Sustainable Development Within Papua New Guinea", Journal of Agricultural and Environmental Ethics 6(1993):89-102. It is the contention of this paper that some progress in alleviating the social and environmental problems which are beginning to face Papua New Guinea can be achieved by supporting traditional Melanesian values through maintaining the customary system of communal land tenure. In accordance with this aim I will proceed to contrast certain Western attitudes towards "individual freedom", "self-interested behavior", "individual and communal interests" and "private ownership" with attitudes and values expressed in the traditional Melanesian approach. I will describe how the emergence of a cash economy and the attachment to Western gadgetry and products have effected injury to the environment and undermined values which have previously maintained Melanesian social cohesion. Lea is in psychology and philosophy at the University of Papua New Guinea, Papua New Guinea.

Lea, John P., "Tourism Development Ethics in the Third World," Annals of Tourism Research 20(1993):701-715. The origins of ethical concern about tourism development in the Third World are traced in both the sociology of development and the environmental ethics literature. New secular and religious writings single out the traveller and the tourism industry as objects of ethical concern. Lea attempts a preliminary overview of the growing "responsible tourism" and travel ethics literature and explores the significance of anti-tourism activity in the Indian State of Goa. He suggests a three-part grouping into Third World development ethics, tourism industry ethics, and personal travel ethics. "It is certain that tourism ethics in general and environmental ethics in particular will become an important subdiscipline within tourism studies in the near future." Lea teaches architecture at the University of Sydney, Australia. (v5,#4)

Leatherman, Courtney. “The Poverty Question.” *Nature Conservancy Magazine* Vol. 58, no. 1 (2008): 42-51. Reducing poverty is at the top of the world’s development agenda. Five conservationists discuss what that means for environmental conservation. For example, Kent H. Redford, who directs the Wildlife Conservation Society Institute, says: “Conservation organizations are bailing out on their responsibility to the natural world and taking on poverty, not as a strategy but as an objective. I think that’s a dangerous move—particularly dangerous for the natural world, which has so few defenses. This is a dangerous infatuation on the part of conservation organizations because we know so little about the topic and because for at least 60 years there have been hundreds of billions [of dollars] devoted to this, and poverty is only increasing. As a result, if we take our meager funds and throw them in this much larger pool, not only will we probably make little difference because we’re innocent players, but we will also be reallocating those funds away from the conservation of nature” (p. 50).

Leax, John, *Standing Ground: A Personal Story of Faith and Environmentalism*. Grand Rapids, MI: Zondervan, 1991. 127 pages. \$ 7.99. A personal account of one man's stand against the building of a nuclear dump near his home. The moral conflicts, fears, angers, and questions Leax faced as he came to terms with the responsibilities of being a steward of the earth. (v6,#4)

LeBlanc (Le Blanc), Jill, "A Mystical Response to Disvalue in Nature," Philosophy Today 45(2001):254-265. Holmes Rolston's account of disvalues in nature is too rationalized; it does not speak to the distress of the individual pained by the stresses of nature. For this one needs a mystical, experiential response, which involves loving all things and doing all one can to alleviate such disvalue in the world. Le Blanc is at McMaster University, Hamilton, Ontario. (v.13,#2)

LeBlanc, Jill. "Eco-Thomism." Environmental Ethics 21(1999):293-306. St. Thomas Aquinas is generally seen as having an anthropocentric and instrumentalist view of nature, in which the rational human is the point of the universe for which all else was created. I argue that, to the contrary, his metaphysics is consistent with a holistic ecophilosophy. His views that natural things have intrinsic value and that the world is an organic unity in which diversity is itself a value requiring respect for being and life in all their manifestations. (EE)

LeBreton (Le Breton), Binka. A Land to Die For. Atlanta: Clarity Press, 1997. 151pp. \$12.95. Recouping the events surrounding the assassination of Padre Josimo, a black priest internationally recognized for his role in the struggle of impoverished squatters for land, LeBreton captures the grass roots view of the turbulent social fabric of rural Brazil--large landowners, wealthy speculators, politicians, pistoleiros, peasants, and on both sides, the Catholic Church, torn between ancient ritual and contemporary liberation theology, heeding the cries of the poor and calling for justice. Le Breton is a British journalist who lives with her husband in an isolated area of southeastern Brazil. (v8,#3)

Leclerc, Jacques; DesGranges, Jean-Luc, "Exploratory multiscale analysis of the fish assemblages and habitats of the lower St. Lawrence River, Quebec, Canada," Biodiversity and Conservation 14(no.5, May 2005):1153-1174(22).

Leddy, Thomas. "A Defense of Arts-Based Appreciation of Nature." Environmental Ethics 27 (2005):299-315. In a pluralist and pragmatist view of aesthetic appreciation of nature, nature is validly appreciated through various cultural media including science, technology, mythology, and, in particular, the arts. Those who attack arts-based appreciation mainly think about the arts of the nineteenth century: traditional landscape painting and sculptures on pedestals. When we turn to art since the 1970s, for example, earth art, this picture changes. Allen Carlson's attack on postmodernist and pluralist models of aesthetic appreciation does not pose significant problems for an arts-based approach, for he makes a major concession to non-scientific culture-based approaches when he allows mythological descriptions. If mythology can be taken into consideration when appreciating the natural environment, then the arts should be as well. The aesthetic object in environmental aesthetics is emergent from, and upon, the interaction of the experiencing subject(s) and the appreciated environment, the limits of which are set by the experiencing subject(s). These limits need not be narrowly science-based. (EE)

Ledoux, Arthur O., "A Green Augustine: On Learning to Love Nature Well," Theology and Science 3 (no. 3, 2005): 331-344. Augustine of Hippo has expressed a vision of beauty in nature that could, if better known, encourage traditional Christians and secular ecologists to affirm the ground they have in common. For Augustine the ideal would be to see nature as God sees it, feeling deeply both its beauty and its impermanence, loving nature without clinging to it. With such clear seeing would come love and the motivation for sustained and skillful action. Ledoux is in philosophy, Center for Augustinian Study and Legacy, Merrimack College, North Andover, MA.

Leduc, Thomothy B., "Approaching a Climatic Research Ettiquette," Ethics and the Environment 12(no. 2, 2007):45-70. This paper examines the way in which climate change's complexity calls forth dialogue on various cross-cultural dimensions which resonate with its multi-dimensional reality. While the IPCC science and the Kyoto Protocol approach this inclusiveness, they ultimately limit the range of voices

heard due to the continuation of cultural assumptions that are intertwined with many environmental issues. Following the Earth Charter as an alternative model of cross-cultural dialogue that can inform a methodological approach of climate change, this analysis suggests that a more inclusive sharing can offer a way of attending to limiting assumptions as a means to creating viable regional and global responses. This climatic research etiquette is clarified through focusing upon the continued dominance of economic scarcity and its religious precursor, original sin, in contemporary environmental thought. Leduc is a Ph.D. candidate, Faculty of Environmental Studies, York University, Toronto.

Lee, Charles. "The Integrity of Justice: Evidence of Environmental Racism" Sojourners (February/March 1990): 22-25.

Lee, Donald C. "Some Ethical Decision Criteria with Regard to Procreation." Environmental Ethics 1(1979):65-69. A response to Daniel Callahan's claim that although population growth has been a longstanding value it now poses a threat to human beings as well as to ecosystemic health. With particular attention to the rank ordering of freedom and the right to procreate. One does not have a right to procreate to unlimited procreation that threatens the very survival of the species. Lee is in the department of philosophy, University of New Mexico, Albuquerque, NM. (EE)

Lee, Donald C. "Toward a Marxian Ecological Ethic: A Response to Two Critics." Environmental Ethics 4(1982):339-43. To the claim that Marx has no concept of human nature after 1845 and is not prescriptive, I reply that his work only makes sense in the light of his definition of the human being as creator and producer of himself through his own productive activity; otherwise, there is no reason that labor should "naturally" belong to the laborer, since other animals live from each other's labor and exploitation is natural. Marx's rejection of exploitation is an ethical principle. On the other hand, I attack the narrow human chauvinism of Marxists which lacks environmental consciousness and concern for other species; I label it "eco-imperialism." Marx had several important insights, but his work in general was not always free of the limitations of his age; I try to point to those insights most instructive in our time with regard to the problems of environment. Lee is in the department of philosophy, University of New Mexico, Albuquerque, NM. (EE)

Lee, Donald C. "On the Marxian View of the Relationship between Man and Nature." Environmental Ethics 2(1980):3-16. Marx holds that mankind has developed from nature and in mutual interaction with nature: nature is not an "other" but is man's body. Capitalism is a necessary stage in mankind's historical development of the mastery of nature, but it regards nature as an "other" to be exploited. Thus, a further historical development is necessary: the overcoming of the dichotomy between man as subject and nature as object. Capitalism bases its concept of wealth on unnecessary production rather than on socially useful production and on the maximization of true leisure and free and creative activity for all. It creates excess pollution and depletes nonrenewable resources as a result of this wasteful, exploitative, unnecessary production. A Marxian solution to environmental problems involves the replacement of capitalism with a rational humane, environmentally unalienated social order. Unfortunately, the actual practice of Marxism has not generally been in accord with its own theory. Such rational, humane social orders have not yet been instituted, but they must be soon. We must take one aspect of Marx's ideas to its logical conclusion: Marxist practice has been, at best, homocentric, but now it must overcome that limitation and truly see nature as our "body." Marxism must become ecologically aware; mankind must become the steward of its "body": the ecosystem upon which it depends and which now depends upon it for its health (homeostasis). Lee is in the department of philosophy, University of New Mexico, Albuquerque, NM.

Lee, Kai N., Compass and Gyroscope: Integrating Science and Politics for the Environment. Washington: Island Press, 1993. 290 pages. \$ 25.00 hardcover. Rigorous science can be the compass and practical politics can be the gyroscope. Uses the Columbia River Basin in the Pacific Northwest as a case study. "Sustainable development is not a goal, not a condition likely to be attained on earth as we know it. Rather it is more like freedom or justice, a direction in which we strive." (v4,#3)

Lee, Kai N., "Sustainability, Concept and Practice Of," Encyclopedia of Biodiversity 5: 553-568. Biodiversity is dependent on sustainable utilization of the natural world by humans, and the conservation of biodiversity may well be essential to the durability of the human species. Is a sustainable economy possible? Recent scientific appraisals suggest that it is but that a transition toward sustainability will require significant social, political, and technological changes during the next two generations. This is also the time period in which human population seems likely to level off; hence, it is possible to think of a sustainability transition on the timescale of the demographic transition drawing to a close during the twenty-first century. (v.11,#4)

Lee, Keekok, Holland, Alan, and McNeill, Desmond, eds., Global Sustainable Development. Edinburgh: Edinburgh University Press. Explores some of the complexities surrounding sustainable development in terms of the concept itself as well as at the level of implementation and policy. Challenges facing those who wish to invoke the notion both in their thinking and their planning, whether in the developing South or the developed North. The contributors, coming from different parts of the world, from very different backgrounds and disciplines bring their own distinctive perspective to bear on the issues they have respectively identified as relevant and crucial. Lee and Holland are at the University of Lancaster. McNeill is at the University of Oslo. (v.11,#3)

Lee, Keekok, "An Animal: What is it?," Environmental Values 6(1997):393-410. ABSTRACT: This paper will argue that posing the question what is an animal? is neither irrelevant nor futile. By looking more closely at four conceptions of what is an animal as held implicitly by the general public, by certain philosophers of animal liberation, by apologists for zoos and by the community of zoologists, it will attempt to show that the first three are partial and decontextualised. On the other hand, the zoological account is obviously more comprehensive, and it will be argued that, if suitably teased out, it involves a properly contextualised conception set against the notions of species, habitat, ecosystem and of evolutionary processes in the past (as well as the future). Such a rounder and more historical characterisation will transcend the usual polarisation between so-called individualism and holism in environmental philosophy. The transcendence of this perceived dichotomy is shown also to have practical implications for environmental policy-making with regard to issues like biodiversity and the saving of animals from extinction. Department of Philosophy University of Manchester, Manchester, UK. (EV)

Lee, Keekok, "The Source and Locus of Intrinsic Value," Environmental Ethics 18(1996):297-308. In the

literature of environmental philosophy, the single most potent argument that has been made against the claim that nature may possess intrinsic value in any objective sense is the Humean thesis of projectivism and its associated view that human consciousness is the source of all values. Theorists, in one way or another, have to face up to this challenge. For instance, J. Baird Callicott upholds this Humean foundation to modern Western philosophy. However, by distinguishing between the source and locus of value, he makes it possible to argue that nature is the locus of intrinsic value without at the same time compromising the thesis that human consciousness is the source of all values. On the other hand, Holmes Rolston, III, another eminent environmental philosopher, criticizes the distinction as well as challenges the Humean foundation itself. In this article, I attempt to resolve the disagreement between Callicott and Rolston over this particular distinction, thereby doing justice to the insights which each theorist, undoubtedly, has brought to bear on the issue of intrinsic value, at least as far as individual organisms is concerned. However, I am also critical of both for having failed to draw out the full implications behind certain crucial distinctions that should be made about the notion of intrinsic value itself. Lee is in philosophy, University of Manchester, UK. (EE)

Lee, Keekok, The Natural and the Artefactual: The Implications of Deep Science and Deep Technology for Environmental Philosophy. Lanham, MD: Lexington Books (Rowman & Littlefield), 1999. Pages 288. ISBN 0-7391-0061-0. \$35.00 cloth. Focuses on ontology in the ongoing debates in environmental philosophy, by making the distinction between the natural and the artefactual. Argues that the crisis facing our kind of industrial civilisation is not so much ecological as ontological in character. Science and technology are dynamic; while extant or older technologies are indeed polluting, newer ones or those on the horizon would be increasingly less so.

Technological fixes, however, of this kind mask the true nature of the reality facing us--the sunrise technologies (like biotechnology), are nature-replacing, rather than nature-saving technologies. The price we are being asked to pay for a cleaner environment via such technologies will be the elimination of nature as the ontological other. In other words, our science and our technology increasingly allow us to systematically transform the natural to become the artefactual--the ultimate outcome would be a narcissistic civilisation where nearly everything around us is nothing but the product of human intentions, designs and ends. What we admire then would no longer be nature's creativity and ingenuity but our own human creativity and ingenuity.

In order to grasp the radical powers of today's technologies and those in the near future, one must also grasp the complex relationships between science and technology in the past and in modern times. These may be explored in turn in the relationships between the history and philosophy of science on the one hand and the history and philosophy of technology on the other.

Lee challenges one of the central assumptions of contemporary environmentalism: that if we could reduce or eliminate pollution, we could "save" the planet without unduly disrupting our modern, industrialized societies. Lee argues instead that the process of modernization, with its attendant emphasis on technological innovation, has fundamentally transformed "nature" into just another man-made "artefact." Ultimately, what needs to be determined is whether nature has value above and beyond human considerations, aesthetic, spiritual, or biological. Provocative, a revolutionary attempt to reconfigure environmental ethics, positing the existence of two separate ontological categories - the "natural" and the "artefactual." Natural entities, whether they are organisms or inert mater, are "morally considerable" because they possess the ontological value of independence, whereas artefacts are created by humans expressly to serve their interest and ends.

Contents:

--Chapter: 1. Worldviews: Modern and Pre-modern Modernity; The Old Philosophy and the Old Science; The New Science and Its Method, includes Modern Science and the History of Technology: Transforming the Natural to Become the Artefactual.

2. Modern Technology, the Philosophy of Technology, and the Philosophy of Science.

Chapter 3: Independence, Human Design and Artefactivity, including the Natural: Different Senses of 'Nature' and the End of Nature?

Chapter 4: Technology: Threats to the Natural, Extant Technology and the Less Radical Threat to the Natural, including the Humanization of Nature, and the Naturalization of Humanity.

Chapter 5: Ontology and Axiology, Abiotic Nature and Intrinsic Value.

Appendix 2: Is Nature a Mere Social Construct?

Lee, Keekok. "Beauty for Ever?" Environmental Values 4(1995):213-225. This paper is not primarily about the philosophy of beauty with regard to landscape evaluation. Neither is it basically about the place of aesthetics in environmental philosophy. Rather, its aim is to argue that while aesthetics has a clear role to play, it cannot form the basis of an adequate environmental philosophy without presupposing that natural processes and their products have no role to play independent of the human evaluation of them in terms of their beauty. The limitations, especially of a subjective aesthetics, are brought out through examining the decision of the National Trust in the Lake District to restore Yew Tree Tarn, thereby 'to ensure its beauty will be permanent'. But should a landscape (an ecosystem for that matter) be 'frozen' against natural changes in order that its beauty be preserved 'permanently'? If not, what counter principle(s) can one invoke to argue against such a philosophy of management or at least to limit such intervention in its name? The National Trust is committed 'to preserving the beauty and unique character of the Lake District'. Its unique character includes its geological formations which make the area beautiful. But geological processes are dynamic. Should their products necessarily be subordinated to aesthetic considerations? If so, are they not in danger of being treated like a work of art, an artefact which we, humans, are entitled to preserve against change? In a conflict between the requirement of conserving beauty of the landscape on the one hand and natural processes at work which might undermine that beauty on the other, should aesthetic considerations always have priority? However, the restoration of Yew Tree Tarn as opposed to the failure in Yosemite to intervene to prevent one of its lakes from drying out are merely used as handy examples to lead into such theoretical exploration which should, most certainly, not be interpreted as a general indictment of the overall management policies of the National Trust on the one hand, or endorsement of those of the Yosemite National Park on the other. KEYWORDS: natural beauty, geological, processes, products, subjective aesthetics, nature as a work of art. Lee is at the Centre for Philosophy and Environment, University of Manchester. (EV)

Lee, Keekok. "Instrumentalism and the Last Person Argument." Environmental Ethics 15(1993):333-44. The last person, or people, argument (LPA) is often assumed to be a potent weapon against a purely instrumental attitude toward nature, for it is said to imply the permissible destruction of nature under certain circumstances. I distinguish between three types of instrumentalism--strong instrumentalism (I) and two forms of weak instrumentalism: (IIa), which includes the psychological and aesthetic use of nature, and (IIb), which focuses on the public service use of nature--and examine them in terms of two scenarios, the apres moi, le deluge and the "ultimate humanization of nature" scenarios. With regard to the first, I show that LPA is irrelevant to all the three versions of instrumentalism. With regard to the second scenario, I show that even though it is redundant insofar as (I) is concerned and irrelevant insofar as (IIa) is concerned, it is, surprisingly, effective against (IIb), despite the fact that as a form of weak instrumentalism it is not the target of LPA. In addition, I examine the implications of LPA for the three variants when it is applied to the preservation rather than the destruction of nature and conclude that LPA is effective against (I) and (IIb), but not as effective against (IIa), which can recognize a permission, though not a duty, to save nature. Lee is in the department of philosophy, University of Manchester, Manchester, U.K. (EE)

Lee, Keekok. Social Philosophy and Ecological Scarcity (London and New York: Routledge, 1989). Lee, a philosopher at the University of Manchester, intends this work as the first systematic study of the implications of ecological scarcity for social philosophy. She finds neither of the two major competing social philosophies (capitalism and Marxist socialism) to be adequate, but recognition of the ecological

crisis should lead to a frugal mode of socialism which makes fewer, rather than more demands on the absolutely scarce ecological resources. (v1,#2)

Lee, Wendy Lynne, "On Ecology and Aesthetic Experience: A Feminist Theory of Value and Praxis," Ethics and the Environment 11(2006):21-41. My aim is to develop a feminist theory of value-an axiology-which unites two notions that seem to have little in common for a theorizing whose ultimate goal is justice-driven emancipatory action, namely, the ecological and the aesthetic. In this union lies the potential for a critical feminist political praxis capable of appreciating not only the value of human life, but those relationships upon which human and nonhuman life depend. A vital component of this praxis is, I argue, the potential for an aesthetic experience whose value is exemplified in those actions that tend to foster respect for biodiversity and ecological stability. Lee-Lampshire, Wendy, "Anthropomorphism Without Anthropocentrism: A Wittgensteinian Ecofeminist Alternative to Deep Ecology," Ethics and the Environment 1(no.2, 1996):91-102. While articulating a philosophy of ecology which reconciles deep ecology with ecofeminism may be a laudable project, it remains at best unclear whether this attempt will be successful. I argue that one recent attempt, Carol Bigwood's feminized deep ecology, fails in that, despite disclaimers, it reproduces important elements of some deep ecologist's essentializing discourse which ecofeminists argue are responsible for the identification with and dual oppression of women and nature. I then propose an alternative model for

conceiving and describing human and nonhuman nature modeled on Wittgenstein's remarks concerning anthropomorphizing which I argue is immune to this criticism. Lee-Lampshire teaches philosophy at Bloomsburg University of Pennsylvania. (E&E)

Leeson, S., "The Need for Growth Promoting Compounds in Poultry Meat Production", Journal of Agricultural and Environmental Ethics 4(1991):89ff. Modern strains of broiler chicken are capable of achieving a 2.4 kg liveweight at 42d of age. This extremely fast growth is accomplished in part by balanced diets containing pharmaceutical growth promoting compounds. Over the last few years, a number of ethical questions have arisen regarding the use of such compounds. Such fast growth rate is accompanied by reduced bird welfare related to morbidity and mortality of a proportion of the birds. In two trials we have shown that acceptable growth rate can be achieved in diets without these compounds, and that economics of production are not adversely affected. It is concluded that future management programs for broiler chickens should consider a tempering of growth rate and that this could lead to improved bird well-being.

Directed toward congregations, this book offers practical ways small groups or individuals can get involved and make a difference. (v5,#2)

Lehman, Hugh, Clark, E. Ann, and Weise, Stephan F., "Clarifying the Definition of Sustainable Agriculture", Journal of Agricultural and Environmental Ethics 6(1993):127-144. A number of distinct definitions of sustainable agriculture have been proposed. In this paper we criticize two such definitions, primarily for conflating sustainability with other objectives such as economic viability and ecological integrity. Finally, we propose and defend a definition which avoids our objections to the other definitions. Lehman is in philosophy at the University of Guelph, Ontario. Clark and Weise are in crop science at the University of Guelph, Ontario.

Lehman, Hugh, "Are Value Judgments Inherent in Scientific Assessment?", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. This paper is divided into three parts. In Part I, I discuss the view of Bernard Rollin on the question posed in the title of the paper. To reply to the position taken by Rollin a critic would need to make a distinction between value commitments made in the social context within which people do science from possible value commitments of science itself. Since investigating that distinction would take us far afield, in Part II, I make and defend an assumption concerning scientific method. If there are value commitments of science itself, we should be able to indicate what they are by reference to our description of scientific method. In Part III, I argue that value commitments do enter into the application of scientific method at each stage and so are indeed inherent in science itself. Further, I shall suggest here that conflicts concerning the nature of scientific method reflect, in part, conflicts among scientists and other people with regard to what values can be considered to be values of science itself. As part of this discussion I will also call attention to the grain of partial truth which is reflected in scientists' claims that science is value free. Lehman is in the Department of Philosophy, University of Guelph, Guelph, Ontario Canada N1G 2W1.

Lehman, Hugh, "On the Moral Acceptability of Killing Animals", Journal of Agricultural Ethics 1(1988):155-162. In this paper we argue that, even if we grant the basic assumptions of a "rights view" (killing of animals if they are innocent threats or shields or are in a "lifeboat situation"), a good deal of killing of animals for food and scientific research continues to be morally acceptable. Lehman is in philosophy at the University of Guelph, Ontario.

Lehman, Scott Privatizing Public Lands. New York: Oxford University Press, 1995. 240 pages. \$45. The federal government retains roughly a quarter of the U.S. lands, and managing them is often expensive and contentious. A solution, some argue, is privatization. A free market directs privately-owned resources to their most productive uses. Lehman argues that there is no sense of "productivity" for which it is true that greater productivity is both desirable and a likely consequence of privatizing public lands or "marketing" their management. Lehman is in philosophy at the University of Connecticut. (v6,#1)

Lehmann, Scott. Review of Why Preserve Natural Variety? By Bryan G. Norton. Environmental Ethics 10(1988):275-78.

Lehmann, Scott. "Do Wildernesses Have Rights?" Environmental Ethics 3(1981):129-46. Although preservationists sometimes allege a right of wild areas to remain wild, their arguments do not warrant the ascription of such a right. It is hard to see how any argument to this conclusion could be persuasive, for (1) X having a right to Y requires that depriving X of Y injure X (other things being equal), and (2) the only X we have reason to think can be injured is an X which possesses consciousness. On the other hand, rights are problematic creatures, and the individualistic moral view they presuppose does not accord well with the holistic perspective of many preservationists. While it might be possible to develop this perspective into a moral theory that gives wilderness intrinsic value, there seems a greater need for clarifying the policy implications of accepted moral principles. From the book: "Many of our deepest thinkers and many of those most familiar with the scale of the challenges we face have concluded that the changes needed to sustain human beings and natural communities can only be achieved in the context of the rise of a new consciousness. For some, it is a spiritual awakening—a transformation of the human heart. For others it is a more intellectual process of coming to see the world anew and deeply embracing the emerging ethic of the environment and the old ethic of what it means to love thy neighbor as thyself. But for all it involves major cultural change and a reorientation of what society values and prizes most highly."

Lemons, John, "Cooperation and Stability as a Basis for Environmental Ethics." Environmental Ethics 3(1981):219-30. Philosophers and ecologists have proposed that ecological principles such as cooperation and ecosystem stability serve as a basis for environmental ethics. Requisite to understanding whether a cooperation based environmental ethic can be taken as an unqualified good is knowledge of the role of cooperation in the context of other interactions between species (e.g., competition), and the significance of such interactions to ecosystem stability. Further, since the key ecological concept of stability has been ambiguously defined, the various definitions need to be understood so that use of scientific information in philosophical discussion is accurate and consistent. Lemons is at Environmental Studies, New England College, Henniker, NH. (EE)

Lemons, John, ed., Readings from the Environmental Professional. Three volumes: I. National Environmental Policy Act. II. Natural Resources. III. Risk Assessment. Cambridge, MA: Blackwell Science, 1995. \$ 24.95 each. Each volume is a collection of the most interesting, lively, and topical articles that have appeared in the journal The Environmental Professional. Typically about three dozen papers. The Natural Resources volume, for example, contains the exchange between J. Baird Callicott, "The Wilderness Idea Revisited: The Sustainable Development Alternative," and Holmes Rolston, "The Wilderness Idea Reaffirmed," and also Kristin S. Shrader-Frechette and Earl D. McCoy, "Ecology and Environmental Problem-Solving," also David Orr, "What Is Education For?" Lemons, John, ed. Scientific Uncertainty and Environmental Problem Solving. Malden, MA: Blackwell Science, Inc., 1996. 512 pp. \$80. Four major classes of uncertainty are addressed: framing uncertainty, modeling uncertainty, statistical uncertainty, and decision-theoretical uncertainty. Contributors give specific guidelines for decision making within existing limitations. (v8,#1)

Lemons, John, "The Need to Integrate Values into Environmental Curricula," Environmental Management 13(no. 2, 1989):133-147. Many environmental problems are controversial because of conflicting values and there is no consensus as to which values should have precedence. Environmental managers must have a full understanding of such values and the principles of ethics that can be used in

decision making. Unfortunately, the integration of values into curricula has often not been explicit or comprehensive. University-trained environmental managers do not possess the knowledge, skills, and methods necessary for more ethically based decisions. Specific curricula are analyzed. Environmental programs should more fully include teaching about values and ethics. Lemons is in the Division of Life Sciences, University of New England and is editor of The Environmental Professional. (v2,#1)

Lemons, John, Donald A. Brown, and Gary E. Varner. "Congress, Consistency, and Environmental Law." Environmental Ethics 12(1990):311-27. In passing the National Environmental Policy Act of 1969 (NEPA), Congress committed the nation to an ethical principle of living in "productive and enjoyable harmony" with the natural environment. Thus understood, NEPA can be given either (1) a technology-forcing interpretation or (2) an intelligent decision-making interpretation. We argue that in its subsequent decision to site a high-level nuclear waste repository at Yucca Mountain, Nevada, Congress acted inconsistently with this principle under either interpretation. We conclude that for the foreseeable future, the only way to handle the nation's nuclear wastes consistent with the environmental goal enunciated in NEPA is to leave them in temporary surface storage facilities, prohibit the licensing of any new nuclear power plants, and take all appropriate steps to reduce the nuclear weapons industry. Lemons is at the Dept. of Life Sciences, University of New England, Biddeford, ME. Brown is in the department of Environmental Resources, Harrisburg, PA. Varner is at the Philosophy Dept., Texas A & M, College Station, TX. (EE)

Lemons, John, Donald A. Brown, and Gary Varner, "Congress, Consistency, and Environmental Law: Nuclear Waste at Yucca Mountain, Nevada," Environmental Ethics 12(1990):311-327. Discusses the moral implications of the National Environmental Policy Act of 1969 (NEPA) and shows how Congress acted inconsistently in the selection of Yucca Mountain as a nuclear waste disposal site. The argument assumes that Congress had an ethical principle in mind when NEPA was created. (Katz, Bibl # 2)

Lemons, John. "Atmospheric Carbon Dioxide: Environmental Ethics and Environmental Facts." Environmental Ethics 5(1983):21-32. Environmental philosophers often assume that we lack metaethical concepts and normative criteria for environmental decisions, but that we have all the facts we need from the environmental sciences. This is contested in the case of our obligation to future generations as affected by current decisions regarding increased fossil fuel use, decisions which affect both the immediate and long-range future, and which must be made deliberately or by default before we know the long-term effects of increased carbon dioxide in the atmosphere. Some suggestions are offered about decision making in the absence of sufficient factual information. Lemons is at the Dept. of Biology and Ecology, Deep Springs College, California. (EE)

Lenman, James. "Preverences in their Place." Environmental Values 9(2000):431-451. ABSTRACT: In at least some of their forms, Cost-Benefit techniques for the evaluation of environmental projects and policies treat the preferences of citizens as the sole determinants of the value of outcomes. There are two salient ways in which this supposition might be defended. The first is metaethical and appeals to considerations about how we must understand talk of environmental and other values. The second is political and appeals to considerations about democratic legitimacy and the proper aims of public policy. Metaethical considerations, I argue, are something of a red herring here. Roughly subjectivist understandings of our talk of values may be appealingly metaphysically unassuming, but in their most plausible formulations they do not support a view of preferences as the sole determinants of value. Political considerations, on the other hand, are to be taken very seriously. They offer, however, no straightforward rationale for any crudely preferentialist measure of social value. Findings obtained from the use of cost-benefit techniques might sometimes have a legitimate role as an input into, but not as a substitute for, political deliberation. Questions about the scope and limits of such legitimacy are properly addressed in political and not in metaethical terms.

Leon, Warren, and Brower, Michael, The Consumer's Guide to Effective Environmental Choices: Practical Advice from the Union of Concerned Scientists. Pittsburgh: Three Rivers Press (Carnegie Mellon University), 1999. 304 pages. \$ 15, paper. Forget about paper versus plastic bags, cloth versus disposable diapers, paper cups versus ceramics; none of this makes any serious environmental impact. There are other, much more important things to feel guilty about. Worrying about the trivial things distracts us from the four big culprits: cars, meat, home appliances, and climate control. They have the greatest impact on environmental quality. You are kidding yourself if you drive your Land Rover to the grocery store and worry about buying disposable cups. A study prepared by the Union of Concerned Scientists, among the greenest of U.S. environmental groups. (v.10,#1)

Leonard, Liam, "Environmentalism in Ireland: Ecological Modernisation versus Populist Rural Sentiment," Environmental Values 16(2007): 463-483. The recent phase of economic growth in the Republic of Ireland has led to an increase in industrial and infrastructural development across the island. One offshoot of this accelerated growth has been a rise in community based environmental movements, as environmentalists and concerned communities have come to mobilise campaigns to protect local communities and hinterlands. This paper examines the contestation of two forms of environmentalism, institutional ecomodernism versus a grassroots ecopopulism within the context of the ongoing dispute between a local community in the west of Ireland and both multinationals and the state, who are attempting to run gas pipelines from the Atlantic Corrib Field through the rural community's lands. Liam is in political science and sociology, Environmental Change Institute and SSRC, Galway, Ireland.

Leopold, A. Carl. "Living with the Land Ethic." *BioScience* Vol. 54, no. 2 (2004): 149-54. The son of Aldo Leopold looks at how the land ethic has developed since his father launched it, with some reminiscences about his father. "The entry of ethical concepts into ecological thinking has provided a powerful new guiding principle.... Aldo Leopold's new paradigm of the land ethica new perspective on conservation ecology through ethical preceptshas lead to the appearance of new journals, new professional societies, and numerous new books concerned with environmental ethics." The book includes a bush diagram of some examples of bioethical concepts that have emerged from the land ethic.

Leopold, Aldo, "Means and Ends in Wild Life Management," *Environmental Ethics* 12(1990):329-332. A previously unpublished lecture of Leopold from May 1936 shows that the "land ethic" had its basis in new directions of wildlife management. Leopold wanted to emphasize the development of "aesthetic" ends because of the failure of instrumental means for duplicating natural process. The essay is followed by "A Brief Commentary" by Eugene Hargrove and J. Baird Callicott, pp. 333-337, which notes that the lecture demonstrates how early Leopold had moved away from prudential arguments for a land ethic. (Katz, Bibl # 2)

Leopold, Aldo, *The River of the Mother of God, and Other Essays by Aldo Leopold*. Madison: University of Wisconsin Press, 1991. Susan L. Flader and J. Leopold, Aldo. "Means and Ends in Wild Life Management." *Environmental Ethics* 12(1990):329-32. Although research in wildlife management is repeating the history of agriculture, unlike agricultural research, which employs scientific means for economic ends, the ends of wildlife research are judged in

terms of aesthetic satisfactions as governed by "good taste." Wild animals and plants are economically valuable only in the sense that human performers and works of art are: the means are of the brain, but the ends are of the heart. Wildlife management has forged ahead of agriculture in recognizing the invisible interdependencies in the biotic community. Moreover, it has admitted its inability to replace natural equilibria and its unwillingness to do so even if it could. Because many animals do not exhibit their natural behavior under laboratory conditions, researchers are dependent on observation in the wild. The difficulties involved in isolating variables are especially clear in the study of the natural cycle. It is a problem which seems to defy the experimental method.] Leopold (1887-1948). (EE)

Leopold, Aldo. "Some Fundamentals of Conservation in the Southwest." Environmental Ethics 1(1979):131-41. Leopold first discusses the conservation of natural resources in the southwestern United States in economic terms, stressing, in particular, erosion and aridity. He then concludes his analysis with a discussion of the moral issues involved, developing his general position within the context of P.D. Ouspensky's early philosophy of organism. (EE)
